With regard to the unavoidable misfortunes and anxieties of our prefent fate, fo far from being truly hurtful in themfeives, they are proofs of divine beneficence. When we fee men difpleafed with their fituation, when we hear them complain of the difficulties, the miferies, and the cares of life, of the hardhips which they have undergone, and the lathours which fill lie before them; infleal of accountipg them unfortunate, we ought to regard them as active beings, placed in the only fitua. tion that is fit for the improvement of their nature. That difeontent, thefe reflefs wifhes to improve their condition, are fo many fure indications that their faculties will not languifh. They who are in the leaf de-
 well the infiuence whith pleafure and repofe have in enfechling every manly principle, and how capmble they are of attaching us cvea to a fordid and diffonomabie exiftence.

Hapry indeed it is for the human race, that the number of thefe men is finall whom providence 1 i. $s$ placed in fituaticus in which perfonal ativity is monecelliary. By far the greater number are compelled to exert themfelves, to mix and to contend with their equals, in the race of fortune and of henour. It $i$, thus that our powers are called forth, and that our nature reaches its higheft perfection. It is even perhaps a genaral truth, that they who have ftruggled with the grate variety of hardilips, as they always acquire the highett energy of character, fo if they have tetained hair in. tegrity, and have not fink entircly in the conten, ficidom fail to fpend their remaining lays tefpectabile and happy, fuperior to pathon, and fecuted from folly by the poffifion of a wifdom deanly carned.

But the benefits of phylical cvils have been fet in a 「hytical Atill Rronger light by a great mafter of mo:al wiflom, evil tie who was himfelf fubject to many of thofe evils. Th.tt caure of man is a moral agent, fent into this word to acquire meal. habits of virtue and piety to fit him for a better flate, geal. is a truth to which no confiftent theif will for a moment refufe his affent. liut almof all the moral gocul which is left among us, is the apparent effect of plytical evil.
"Goodnefs is divided by divines into foberr.cfs, righl. Johnfon's teoufnefs, and godlinefs. Let it be examined how each idler, $1^{\circ}$ of thefe duties would be pracifed if there were no phy- 29. fical evil to enforce it.
"Sobriety or temperance is nothing but the forbearance of pleafure; and if pleafure was not followed by pain, who would forbear it? We fee every hour thofe in whom the defire of prefent indulgence overpowers all fenfe of paft, and all forefight of tuture mifery: In a remiffion of the gout, the drunkard returns to his wine, and the glutton to his feaf; and if neither difeafe nor poverty were felt or dreaded, every one would fink down in idle fenfuality, without any care of others, or of himfelf. To eat and drink, and lic down to fleep, would be the whole bufinefs of mankind.
"Righteoufnefs, or the fy fem of focial duty, may ! c fubdivided into juftice and charity. Or jullice, one of the heathen fages has fhown, with great acutenefs, that it was impreffed upon mankind only by the incoaven ences which injuntice had produced. 'In the firnt ages (fays he) men acted without any rule but the impulfe of defire ; they practifed injuftice upon othere, and fuffered it from others in their turn: but in time it was difcovered, that the pain of finfering wrong wiss greater than the pleafure of doing it; and mankind, by a general compact, fubmitted to the reftraint 'f haws, and refigned the pleafure to efrape the pain,'
"Of charity, it is fuperfluous to obferve, that it could have no place if there were no want; for of a virthe which could not be pracifed, the omilion could not be culpable. Evil is not only the cccalional but the efficient caure of charity; we are incited to the relief of mifery by the confcioufnefs that we have the fame nature with the fufferer; that we are in danger of the fame difrefes, and may fometime implore the fame anliftance.
"Godline

$$

Providence " Goulinefs cr piety is clevation of the mind towards the Supreme Being, and extenfion of the thoughts of another life. Thic other life is future, and the Supreme Being is invifible. None would have recourfe to an invifible power, but that all oher fubjects had eluded the'r hopes. None would fix their attention upon the future, but that they are difcontented with the prefent. If the fenfes wera fafted with perperual pleafure, they would always keep the mind in fubjection. Reafin has no authority over us but by its power to warn us asaint evil.
" In childhood, while our minds are yet unoccupied, religion is impreffed upon them; and the firft years of almoll all who have been well educated are paffed in a regular difcharge of the duties of picty: But as we advance forward into the coowds of life, innumerable de. lights folicit our inclinations, and inumerable cares dittract our attention. The time of youth is paffed in noify frulics; manhood is led on from hope to hope, and from project to project ; the diffolutenefs of pleafure, the incbriation of fuccefs, the ardour of expcetation, and the vehomence of competion, chain down the mind alike to the prelent foene: nor is it remembered how foon this mift of trifies muift be fcattered, and the bubbles that float upon the rivulet of life be loft for ever in the gulpho of eiernity. To this confideration fcarce any man is awakened but by fome prefling and refiftefs evil; the death of thofe from whom he dcrived his pleatures, or to whom he deftined his pofdefflons, fome difeafe which thows him the vanity of all external acquifitions, or the gloom of age which in te. cepts his profpeets of long enjoyment, forces him to tix his hopes upon another thate ; and when he has contended with the tempents of life till his ftrength fails him, he flies at lat to the fhelter of religion.
"That mifery does not make all virtuous, experience too certainly informs us; but it is no lefs certain, that of what virtue there is, mifery produces far the greater part. Phyfical evil may be therefore endured with patience, fince it is the caufe of moral good; and patience itfelf is one virtue by which we are prepared for that fate in which evil flall be no more."

The calamities and the hardhips of our prefent fate, then, are fo far from being real evils, of which providence ought to be accufed, that in every point of view in which we can confider them, they afford the fureft proofs of the wifcom of its adminittration, and of its goodnefs to man.

The moft ferious difficulty lies in accounting for the permiffion of moral evil or guilt, in a fyltem governed by infinite benevolence and wifdom. Thofe who in a confiflent marner hold the docirine of the abfolute neceffity of human actions in its full extent and acknowledge all its confequences, find it eafy to clude this dimiculty. They very fairly deny the exitence of any fuch thing as moral cvil in the abfract ; and alfert, that wh. it we call a crime, is nothing more than an action which we always regard with a painful fenfation: that thefe apparent evils endure only for a time; and that all will at laft terminate in the perfection and happinels of eve$r y$ intelligent being.

Upon the fyltem of liberty, the Chorteft anfiwer feems to be this: that fome things are abfolutely impolible, not from any weaknefs in the Deity, but becanfe they infer alafurdity or contradiation. Thus it is imponible
for twice two to be any thing elfe llan four ; and thus it is impolible for Omnipotence itfulf to confer felfapprobation upon an intelligent being who has never deferved it; that is to fay, it is imponible for a man of fenfe to be pleafed with himfle for having done a certain action, while he himfelf is confcious that he never did that action. But felf-approbation confitutes the higheft, the moft unmingled, and permanent felicity, of which our nature is capable. It is not in the power of Omnipotance itfelf, then, to beftow the highelt and moft permanent felicity of our nature; it muft be earned and deferved before it can be obtaincd. In the fame manner good defert, virtue or merit, camart be conferred ; they muft be acquircd. To enable us to acquire thefe, we uualt be expofed to difficulties, and muft fuffer in a certain degree. If thele difficulties had no influence upon our conduct and feelings, if they expofed us to no real danger, no fabric of merit and of felfapprobation could be reared upon them. All that the Supreme Being could do for us, was to confer fuch an original conflitution and charater as would enable us to do well if we thould exert our utmof powers. The univerfe is not ruled by favour, but by juftice. Complete felicity mult be purchafed. Guilt is an abufe of our freedom, a doing ill where we could have done well, and is entirely the work of man. Heaven could not avoid permitting its exiltence, and expofing us to danger; for temptati. $n$ is neceffary to virtue, and virtue is the perfection of our nature, our glory, and our happinefs.

The permifion of moral evil has been fo ably ac- By ${ }^{27}$ counted for by Simplicius, a Pagan writer, and there- cius, fore not biaffed by any partiality to the Jewifh or Chrifian Scriptures, that we cannot deny ourrelves the pleafure of laying his reafoning before our readers. He afks *, "Whether God may be cailed the author of fin, becoure he permits the foul to ufe her liberty? and anfwers the queftion thus:
"He who fays that God flonld not permit the es pict. P ercife of its frecdom to the foul, muit affirm one of ed, sal thefe two things; either that the foul, though by nature capable of indifferently cloofing good or evil, thould yet be cinftantly prevented from clioofing evil; or elfe that it fhould have been made of fuch a nature as to have no power (f choofing evil.
"The former afferion (comtinues he) is irrational and ablurd; for what kind of liberty would thac be in which there thould be no freedom of choice? and what choice could there be, if the mind were conftantly reArained to one fite of every alternative? With refpect to the fecond alfertion, it is to be obferved (fays he), that no evil is in itfelf defirable, or can be chofen as evil. But if this power of determining iffelf either way in any given cafe mult be taken from the foul, it muft cither be as fomething not good, or ats fome great evil. But whoever faith fo, docs not confider how many things there are which, though accounted grod and defirable, are yet never put in competition with this freedom of will: for without it we fhould be on a level with the brutes; and there is no perfon who would rather be a bute than a man. If God then fhows his goodnefs in giving to inferior beings fuch porfertions as are far below this, is it incongruons to the divine nature and goodnefs to give man a felf-determining power over his aetions, and to permit him the frec exercife of that
power ?
nce power? Mad God, to prevent man's fin, taken away the liberty of his will, he would likewife have deftroyed the foundation of all virtue, and the very nature of man ; for there could be no virtue were there not a polibility of vice; and mar.'s nature, had it continued rational, would have been divine, beeaufe impeecable. Therefore (continues he), though we attribute to God, as its author, this felf-determining power, which is fo neceffary in the order of the univerfe; we have no reafon to attribute to him that evil which comes by the abufe of liberty: For God doth not caufe that avertion from good which is in the foul when it funs; he only gave to the foul fuch a power as might turn itfelf to cvil, out of which he produres much gond, which, without fuch a power, could not have been produced by Omnipotence itfelf." So confonant to the doctrine of our feriptures is the reafoning of this opponent of the writings of Mofes! Fas eft et ab hofle docuri.

The laft objection to the belief of a divine providence arifes from the apparent confufion of human affairs, that all things happen alike to all, that bad men are profperous, and that a total want of juftice appcars to attend the divine adminifrations. Even the beft men have at times been fhaken by this confideration.But there are many reafons for rendering this world a mixed fene: it would become unfit for a fate of trial, and of education to virtue were it otherwife.
It has been fhown already, that phyfical evil is the parent of moral good; and therefore it would be abfurd to expedt that the virtuous fhould be entirely excmpted from that eril. For the occafional profperity of the wicked, many reafons have been affigned even by thofe who, in their difquifitions, were not guided by that revelation which has brought to light life and immortality. "God (firs Plutarch) fpares the wicked, that he may fet to mankind an example of forbearance, and teach them not to revenge their injuries too hatily on each other. He fpares fome wicked men from early punififment, in order to make them inftruments of his juftice in punifhing others. And le fpares all for a time, that they may have leifure fo: repcitance; for men (fays the fame excellent moralif) look at nothing further, in the punifhments which they inflif, than to fatisfy their revenge and ma'ice, and therefore they purfue thofe who have offended tiern with the utmof rage and eagernefs; whereas God, aiming at the cure of thofe who are not utterly incurable, gives them $\mu \varepsilon \tau a \subset a \lambda-$ 2.ertal xpoves, "time to be converted."

But this objeftion receives the beft folution from the doctrine of the immortality of the human foul.

Frovort

Provost, or Prezot Royal, a fort of inferior judge firmerly eftablifhed throughout France, to take cognizance of all civil, perfonal, real, and mixed caufes among the people only.

Grand Prorost of France, or of the Houtehold, had jurildition in the king's houfe, and over the officers therein; looked to the policy thereof, the regulation of provilions, \&c.

Grand Provost of the Confable, a julge who manages procelfes againtt the foldiers in the army who have commitied any crime.

He has four lientenants diftributed throughout the army, called proveffs of the army, and particularly provons in the feveral regments.

Psorost Marthal of atin Army, is an officer appointed to feize and fecurc deferters, and all other criminals. He is to hinder foldiers from pillaging, to inrlit offenders, and fee the fentence paffed on them exconted. He alfo regulates the weights and meafures, and the price of provifions, acc. in the army. For the dicharge of his office, he has a lieutenant, a clerk, and a troop of marihal-men on horleback, as alfo an executioner.

There is alfo a provof-marfhal in the navy, who hath charge over prifoners, \&c.

The French alfo had a provot-general of the marines, whofe duty it was to profecute the marines when guilty of any crime, and to make report thereof to the council of war; befides a marine provoft in every veffel, who was a kind of gaoler, and took the prifoners into his care, and liept the veffel clean.

Provosts of the ITayfals, were a kind of lieutenants of the marhals of France; of thefe there were 180 feats in France ; their chief jurifdifion regarded highwaymen, footpads, houfe-breakers, \&c.

Pror ost of the Mint, a particular judge inflituted for the apprehending and profecuting of falle coiners.

Provost, or Prevot, in the king's ftables; his of fice is to attend at court, and hold the king's firrup when he mounts his horfe. There are four provolts of this kind, each of whom attends in his turn, monthly.

PROW, denotes the head or fure-part of a hip, patticularly in a g.llley; being that which is oppofite to the prop or fern.

1ROXIMITY, denotes the relation of nearnefs, eithe: in refpect of place, blood, or alliance.

PRUDENCE, in ethics, may be defined an abblity of judging what is beft, in the choice both of ends and manns. According to the definition of the Roman moralift, De Officiis, lib. i. cap. 43. prudence is the knowledge of what is to be defired or avoided. According. ly, he makes prulentia (De Legibus, lib. i.) to be a contraaim of provilintia, or forelight. Plato (De Iegibus, lii. iii.) calls this the lcading virtue; and Juvenal, Sat. x. obierves,

## Nullumz numen abeff fit prudentia.

The idea of prodence includes $\approx u \sigma_{x \lambda} \times x$, or due confullation ; that is, concerning fuch things as demand confultation in a right manner, and for a competent time, that the reflution taken up may be neither too precipilate nor to flow ; and ruynot or a facculty of difcerning proper means when they occur; and to the perifection of prudence, thefe three things are farther required, vizu devornt, or a natural fagacity; azavoa, prefence of
mind, or a ready turn of thought; and ausapha, or expe-
rience the extremes of prudence are craft of cunning on the one hand which is the purfuit of an ill end by direet and proper though net honeft means; and folly on the other, which is either a miftake both as to the end and means, or profecuting a good end by foreign and improper means. Grove's Moral Philofophy, vol. ii. chap. ii.

Prudentius, ó Aurelius Prudentius Clemens, a famous Chriftian pnet, under the reign of Theodotus the Great, who was born in Spain in the year 348. He firl followed the profeffion of an advocate, was aftel wards a judge, then a foldier, and at length had an honourab e employment at court. We have a great number of his poems, which, from the choice of his fubjects, may be termed Chriffiun Poems; but the ftyle is barbarous, and very different from the purity of the Auguftan age. The mof efteemed editions of Prudentius's works are that of Amflerdam, in 1667, with Heinfius's Notes, and that of Paris in 1687, in ${ }^{u}$ fum Ditpbini.

PRUNELLA, in botany: A genus of the gymnofpermia order, belonging tothe didynamia claf of plants; and in the natural method ranking under the 12 th order, boloraces. The filaments are bifurcated, with an anthera only on one point; the Itigma is bifid.
PRUNES, are plums dried in the funhine, or in an oven.

PRUNING, in gardening and agriculture, is the lopping off the fuperfuous branches of trees, in order to make them bear better fruit, grow higher, or appear more regular.
Pruning, though an operation of very general ufe, is neverthelefs rightly underftood by few; nor is it to be learned by rote, but requires a ftrict obfervation of the different manners of growth of the feveral forts of fruittrees; the proper method of doing which cannot be known without 'carefully obferving how each kind is naturally difpofed to produce its fruit : for fome do this on the fame year's wood, as vines; others, forthe moft part, upon the former year's wood, as peaches, nectarines, \&c.; and others upon fpurs whicla are produced upon wood of three, four, \&c. to fifteen or twenty years old, as pears, plums, cherries, \&cc. Therefore, in order to the right management of fruit-trees, provifion fhould always be made to have a fufficient quantity of bearing wood in every part of the trees; and at the fame time there fhould net be a fuperfluity of $u$ felefs branches, which would exhault the frength of the trees, and caufe them to decay in a few years.
The reafons for pruning of fruit-trees, are, I. To preferve them longer in a vigorous bearing flate; 2 . To render them more beautiful; and, 3 . To caufe the fruit to be larger and better tafted.
The general inftructions for pruning are as follow. The greateft care ought to be taken of fruit-trees in the fpring, when they are in vigorous growth; which is the only proper feafon for procuring a quantity of good wood in the diffeent parts of the tree, and for difpla. cing all ufelefs branches as to $n$ as they are produced, in order that the vigour of the tree may be entirely diftributed to fix h branches oilly as are defigned to remain. For this reafo:s trees ought not to be neglected in April and May, when their thoots, are prodnced: however thofe branches which are intended for bearing the fucceeding year fhould not be fhortened during the time of their growth, becaufe this would caufe them to produce two lateral thoots, from the eyes b low the place where they were fopped, which would dr.ww much of the Atrength from the buds of the firlt fhort: and if the two lateral thoots are not enirely cut away at the winter pruting, they will prove injurious to the tree. This is to be chichly undestood of ftone-rn't and grapes; but pears and apples, being much larder, fuffer mut fo much, though it is a great diadvantage to thole alfin to be thus managed. It muft likewife be remarked, that peal hes, netarines, apricots, cherries, and plums, are always in the greatefl vigour when chey are leift maimed by the kuife; for whore large branches are taken off, they are fubject to gurn and decay. It is therefore the moft prudent metlod to rub off all ufelefs buds when they are firft produced, and to pinch others, where new floots are wanted to fl!pply the vacancies of the wall; by which management they may be fo ordered as to want but little of the knife in winterpruning. The management of pears and apples is much the fame with thefe trees in fummer; but in winter they mult be very differently pruned: for as peaches and nectarines, for the moit part, produce their fuit upun the former year's wood, and mult therefore h.ave their branches fliortened according to their ftrength, in order to produce new flots for the fucceeding year; fo, on the contrary, pears, apples, plums, and cherries, producing their fruit upon fpurs, which come out of the weod of Eive, fix, and feven years old, fhould not be thortened, becaufe thereby thofe buds which were naturilly difpofed to form thefe fpurs, would produce wood-luranches; by which means the trees would be filled with wood, bur wou'd never produce much fruit. The brancles of fandard-trees fhould never be fhortened unlefs where they are very luxuriant, and, by growing irregularly on one fide of the trees, attract the greateft part of the fap, by which means the other parts are either unfurnifhed with branches, or are rendered very weak; in which cafe the branch fhould be fhortened down as low as is necelfary, in order to obtain more branches to fill up the hollow of the tree : but this is only to be underfood of pears and apples, which will produce fhoots from wood of three, four, or more years old; whereas mott forts of fone.fruit will gum and decay after fuch amputations : Whenever this happens to ftone-fruit, it fhould be remedied by flopping or pinching thofe fhoots in the fpring, before they have obtained too much vigour, which will calufe them to pufh out fide-branches; but this muft be done with caution. You muft alio cut out all dead or decaying branches, which caufe their heads to look ragged, and alfo attraft noxious particles from the air : in doing of this, you fhould cut them clofe down to the place where they were produced, otherwife that part of the branch which is left will alfo decay, and prove equally hurtiul to the reft of the tree; for it feldom happens, when a branch begins to decay, that it does not die quite down to the place where it was produced, and if permitted to remain long uncut, often infeets fome of the other parts of the tree. If the branches cut off are large, it will be very proper, a'ter having fmoothed the cut part exally even with a knife, chiffl, or hatchet, to put on a plafter of grafting clay, which will prevent the wet from foaking into the tree at the wounded part. All fuch branches as run acrofs each other, and occafion a confufion in the head of the Vol. XV.
tree, fhould be cut off; and as there are fecquemis young vigorous floouts on old erees, wh:chate trom th: ald bamches near the truak, and grow uptight into the ledd, thefe thould be carclul!y cut out every ye.rr, left, hy being penmitted to grow, they fill the tree io full of wood.

As to the pruning of foten-trees, if they $b=1$ large, it is heft not toprune themat all; yet, if there be and abtolute $n^{*}$ collity, avoid t.aking , fflarge boughs as much as pollitle. And, 1, If the bough be fmall, cut it fmooth, clofe, and fle ping. 2. It the brancla be large, and the tree ols, cut it cif at three or four feet from the them. 3. If the tree grow crooked, cut it off at the cronk, floping upward, and nurfe up one of the moft promifing thoots for a new item. 4. If the tice grow top heavy, its "hea 1 mult be lightened, and that by thinning the boughs that grow out of the main branches. But if you would have them frring, rub of the huds, and throud up the fide-fhoots. 5. If the fide-bough fill break out, and the top be able to futtain iffelf, give the boughs that put forth in fpring a pruning after Midfumn:er, cu'ting them clofe.

PRUNUS, in botany: A genus of the monogynia order, belonging to the icofandria clafs of plants ; and in the natural method ranking under the 3 th order, Pomacic. The calyx is quinquefid, inferior; there are five petals; the fruit is a plum, having a kernel with proninent futures. There are 15 fecies, of which fix are cultivated in Britain : they are originally natives of America and Siberia.

1. The domeftica, or common plum-tree, grows 20 or 30 feet high, garnihhed with oval, fpear-fhaped leaves, and with the pedunculi for the mof part fingle, terainated by flowers, fucceeded by plums of many different colours, fizes, and fhapes in the varieties. 2. The infititia, wild-plum, or bullace-tree, grows 12 or 15 feet high ; the branches fomewhat finous; the leaves oval, hairy underneath; and the pedunculi by pairs, terminated by white fluwers fucceeded by fmall, round, plumlike fruit of different colours in the varieties. 3. The fpinofa, black-thorn, or floe tree, grows 10 or 12 feet high, very branchy and buflay quite from bottom, armed with frong, fharp fipines, fmall, fpear-fhaped, fmooth leaves, pedunculi growing fingly, terminated by ficwers, fucceeded by fmall, sound, black cherries in autumn, It grows wild everywhere in hedges and woods; and is very proper for planting field hedges, being of very quick and clofe growth. 4. The cerafus, or common cherry-tree, grows 20 feet cr more in height, garmili:d with oval cluters of lanceolate, fmonth leaves, umbellate flowers, fucceeded by clutters of red roundill fruit of different lizes and properties in the varieties. Hanbury fays, " were this tiee fcarce, and with much difficulty propagated, every man, though poffelfed of a fingle tree only, would look upon it as a treafure; fir befides the charming appearance thefe trees have, when befrowed, as it were, all over with bloom in the fping, can any tree in the vegetable tribe be conceived more beautiful, friking, and grand, than a well-grown and healthy cherry-tree, at that period when the fruit is ripe."
The many kinds of cherry-trees afford au almont endlefs variety; all differing in fome refpea in their natanner of fhooting, leaves, flowers, or fruit : two in particular demand admiffinn into the pleafurc-garden; the double-blefomed and the red-fluwering. The pleafing fhow the common cherry-tree makes when in blow is

## PR U .[ 618 P R U

knonn to all ; but that of the double blofomed is much more enchanting. It bloforoms like the other in May; the flowers are produced in large and noble clufters; f.n each feparate flower is as double as a rofe, is very large, and placed on long and flender footftalks, io as to occation the oranches to have an air of eafe and freedom. They are of a pure white; and the trees will be fo profuely covered with them, as to charm the imagination. Standards of thefe trees, when viewed at a diftance, have been compared to balls of fnow; and the nearer we approach, the greater pleafure we receive. 'linefe trees may be kept as dwatfs, or trained up to fandards; fo that there is no garden or plantation to which they will not be fuitable. By the multiplicity of the petals the organs of generation are deltroyed; fo that thofe flowers which are really full are never fuccoeded by any fruit.

The red-flowering cherry-tree differs in no refpeet from the common cherry-tree, only that the flowers are of a pale-red colour, and by many are efteemed on that accourt. Befides the ornament and utility afforded us by the flowers and fruit of the cherry, its timber is a furcher inducement for propagating it ; more efpecially that of the fmall black wilding fort; which may perhaps with propriety be confidered as the genuine fpecies, and a native of Britain. Be this as it may, it will grow, in a foil and fituation it affects, to be a large timber trec; which, if taken in its prime before it become tainted at the heart, will turn out perhaps not lefs than a ton of valuable materials, peculiarly adapted to the purpofes of furniture. The grain is fine, and the colour rearly approaching to that of mahogany, to whiclu valuable wood it comes nearer than any other which this country produces. 5. The avium, or great wild-cherry tree, grows 40 or 50 feet high, having oval, fpear-lhaped leaves, downy underneath, with umbellate feffile clufters of white flowers, fucceeded by fmall round fruit of different properties in the varieties. 6. The padus, or common bird-cherry tree, grows 15 or 20 feet high, of a fhrub-like growth, with a fpreading head, large, oblong, rough, ferrated leaves, having two glands at the back of the bafe like the other, and with fhorter, more eompact clufters of flowers, fucceeded by large red fruit. This grows wild in hedges in the nortly parts of England. 7. The Virginiana, or Virginian bird-cherry, grows 30 feet high, dividing into a very branchy head, having a clark purple bark,oval, flightly ferrated, fhining jreen leaves, having two glands at the forepast of the bafe, and long clullers of white flowers, fucceeded by finall, round, berry-like, black fruit. 8. The Canadenfis, or Canada dwarf bird cherry, grows but four or five feet high, branching horizontally near the ground with fmooth branches; broad, fpear-haped, rough dowriy leaves, without slands; and long clufters of white flowers, fucceeded by fmall, round, berry-like, black fruit, lipe in autumn. 9. The mahaleh, or perfumed -hery, grows io or 15 feet high, with fmonth whitilh branches, fmall, oval, fhininggrcenleaves, and corymbous cinters of white flowers, fucceeded by fmall fruit. 10. The armeniaca, or apricet tree, grows 20 feet high,
with a large fpreading head, having reddifh fhoots, large ncarly heart-fhaped leaves, and clofe-fitting palered flowers rifing all along the fides of the young branches; fucceeded by large, roundilh fruit of a yellow and reddifh colour in different varieties. The fruit and the kernels of the Pranas Siberia, when eaten, excite a continued head-ach: the kernels, infufed in brandy, communicate an agreeable flavour.

Culture. All the different varieties of plums have at firft been raifed from the fones, and are atterwards preferved by budding and grafting on any plum-ftock. The fame method is applicable to cherries; only there are grafted to moft advantage epon ftocks of the wild black and red cherry raifed from the ftones of the fruit. The apricot-trees are propagated by budding on any kind of plum-tocks.

PRUSA (anc. geog.), a town fitmated at mount Olympus in Myfia, built by Prufias, who waged war with Crefus, (Strabo); with Cyrus, (Stephanus): both cotemporary princes. Now called Burfa or Prufa, capital of Bithynia, in Afia Minor. E. Long. $29.5 \cdot$ N. Lat. 39. 22.

PR USlAS, the name of feverdl kings of Bithynia.
Prusias, a town of Bithynia, anciently called Cios, from a cognominal liver, and giving name to the Sinus Cianus of the Propontis; rebuilt by Prufias the fon of Zeia, after having been deftroyed by Philip the fon of Demetrius: it flood on the Sinus Cianus, at the foot of mount Arganthonius. This is the Prufias who harboured Annibal after the defeat of Antiochus.-Ofthisplace was Afclepiades, furnamed Prufieus, the famous phylician.

PRUSSIA, a modern, but defervedly celebrated kingdom of Europe, whofe monarch, along with Pruffia Proper, poffeffes alfo the electorate of Brandenburg, and fome other territories of confiderable extent. The diftrict properly called Prufia is of great extent, and divided into the Ducal and Regal Pruffia, the latter belonging to the republic of Poland till the late partition of the Polifh territories. Both together are of great extent; being bounded on the north by the Baltic, on the fouth by Poland and the duchy of Mazovia, on the weft by Pomerania, and on the ealt by Lithuania and Samogitia. The name is by fome thonght to be derived from migrating from the foot of the Riphran mountains, name. were tempted by the beauty and fertility of the country to fetule there. Others think that the name of this country is properly Porufia; Po in the language of the natives fignifying near, and Porulfurgnifying near Rufla. To the latter etymology we find the king of Prutia himfelf affenting in the treatife intitled Memoirs of the Houfe of Brandenburg. However, it nult be owned, that thefe or any wher etymologies of the word are very uncertain, and we find nothing like it mentionad by hiftorians before the tenth century.

The ancient fate of Pruliia is almolt entirely un- Extreme known. However, the people are faid to have been barbarnty very fuvage and barbarous; living upon raw flefh, and of the andrinking the blood of horfes at their feath, according cient inha to Stella, even to intoxication (A). Nay, fo extremely favage
(A) 'This author does not mention any particular method by which they communicated an inebriating quality th the blool of animals. Poffibly, bowever, the vital fluit may have a property of this kind, though nuknown in-our davs where fuch barbarous cuttoms are difufed. Drunkennefs from drinking blood is frequentIy menioned in Scripture, but whether literally or metaphorically muft be decided by the learned.

## Pik [ Gig ] PRU

Ernfifin, favage were this people, that they were even unacquainted with the method of comtruting huts, and took: up their dwelling in caves and cavities of rocks and trees, where they protected themfel yes and chilliden from the inclemencies of the weather. Among fuch a people it is vain to expect that any tranfariens would be recorded, or indced that any thing worthy of being recorded would be tranfacted. We fhall thereforc begin our hiftory of Pruffia with the time when the Teutonic knights firft got footing in the country. (Sce Tsutonic K̈nights).
On the expulfon of the Chrifians from the Holy Land by Sal:adin, a fettlement was given to the Teutonic knights in Pruffic by Conrade duke of Mazovia, the competitor of Boleflaus V. for the crown of Poland. Their firf refidence in this country was CuIm; to which territory they were confined by the conditions of the donation, excepting what they could conquer from their pagan neighbours, all which the emperor granted to them in perpctuity.

Encouraged by this grant, the knights conquered the greateft part of the country which now goes by the alame of Pruflia; and, not content with this, became very troublefome to Poland, infomuch that the monarchs of that kingdom were fometimes obliged to carry on dangerous and bloody wars with then ; for an account of which we refer to the article Poland, $n^{\ominus} 61.67$, \& c.
The Tentonic order continued in Pruffia till the year 2531. Their laft grand-mafter was Albert Marquis of Brandenburg, and nephew to Sigifmund I. King of Poland. He was preferred to this dignity in hopes that his afinity to Sigifmund might procure a reftitution of fome of the places which had been taken from the order during the former unfuccerfful wars with Poland; but in this the fraternity were difappointed. Albert, howcver, was fo far from endeavouring to obtain any favour from his uncle by fair means, that he refufed to do homage to him, and immediately hegan to make preparations for throwing off his dependence altogether, and recovering the whole of Prufia and Pomerania by force of arms. In this he was io far from fucceeding, that, being foiled in every attempt, he was forced to refign the dignity of grand-mafter; in recompence for which, his uncle beflowed on him that part of Pruffia now called Ducal, in quality of a fecular duke. It was now the intereft of the houle of Brandenburg to affit in the expulfion of the fraternity ; and accordingly, being at Iatt driven out of Pruffia and Pomerania, they transferred their chapter to Mariendal in Franconia; lum in that and other provinces of the empire whace they fetted, little more than the pame of the order once fo fanous now remains.

The other molt confiderable part of his Pruflian maljefty's dominions is the electorate of Brandenburg. Like otber parts of Germany, it was anciently pof. feffed by barbarians, of whom no hifory can be given. Thefe were fubdued by Charlemagne, as is related under the aricle France*; but being on every occafion ready to revolt, in 927 Henry the Fowler eftablifihed margraves, or governors of the frontiens, to keep the barbarians in awe. The firf margrave of Brandenburg was Sigefrop, brother-in-law to the abovemertioned emperor ; under whote adminiftration the bifhrprics of Brandenlburg and Havelberg were eftablifhed by Otho I. From this Sigefroy, to the fuccefion of the houfe of

Ifohenzoilern, finm whnm the prefent cleant is defecndoll, there are ruckunad eis to difictent families, who have been margraves ( $i$ Prindenburg; namely, the tamily of the Saxmes, of Waibeck, Staden, Plenck, Anhalt, Bavani, Luxemburg, and Nitinia. The margraves of the four tirit races had continual wars with the Vandals and othe barbarous people; nor could their ravares be ftopped till the reigro of Albert furnamed the Bear, the firft prince of the houfe of Anhalt. He was made margrave by the emperor Cunrad III. and afterwarls raifed to the dignity of elector by Frederic 13arbarofta, about the ycar ireo. Some years afterwatds the king of the Vandals dying without iflite, left the Middle Marche by his laft will to the clector, who was belides poffeffed of the old March, Upper Saxony, the comatry c.f Aiblalt, and part of Luface. In 1332 this line became extina, and che clectorate devolved to the empire. It was then given by the empercr Louis of Bavaria to his fon Lonis, who was the firft of the fixth race. Louis the Roman fucceeded his brother; and as he alfo died without children, he was fucceeded by Otho, his third brother, who fold the electorate to the emperor Charles IV. of the houfe of Luxemburg, for 200,000 florins of gold. Charles IV. gave the Marche to his fon Wincef:aus, to whom Sigifmund fucceeded. This elector, being embarraffed in his circumftances, fold the New Marche to the knights of the 'Ieutonic order. Joffe fucceeded Sigifmund; but afpiring to the empire, fold the electorate to William duke of Mifnia; who, after he had poffeffed it for one year, fold it again to the emperor Sigifmund. In $1+17$, Frederic VI. burgrave of Nuremberg, received the inventiture of the country of Brandenburg at the diet of Conftance from the hands of the emperor Sigifmund; who, two years before, had conferred upon him the dignity of elector, and arch-chamberlain of the Holy Roman empire.
This prince, the firft of the family of Hohenzollern, found himfelf poffeffed of the cald and Middle Marche, but the dukes of Pomerania had ufurped the Marche Ukraine. Againft them, therefore, the eletor immediately declared war, and foon recovered the proxince. As the New Marche fill continued in the hands of the Teutonic knights, to whom it had beea fold as we have already mentioned, the elector, to make up for this, took poffieffion of S.uxony, which at that time happencd to be vacant by the death of Albert the lalt ele:tor of the Andalt line. But the emperor, not approving of this flep, gave the invelliture of Saxony to the duke of Mifnia; upon which Frederic voluntarily defifted from his acquifitions. This elector made a divifion of his poffeffions by will. His eldelt fon was deprived of his right on account of his having too clofely applied himflelf to fearch for the philofopher's flone; fo le left bim only Voigthund. The electorate was given to his fecond fon Frederic; Albert, furnamed Achilles, had the duchies of Franconia; and Frederic, furnamed the Fat, had the Old Marche; but by his death it returned to the elestorate of Brandenburg.

Frederic I, was fucceeded by his fon, called alfo Fredtric, and furnamed Iron-tooth on account of his frength. He might with as great reafon have been furnamed the Marnanimous, fince he refufed two crowns viz. that of Bohemia, which was offered him

## PRU

l'ruliis. - Mwas invited by the people; but Frederic declared he would not accept of it unlefs Cafimir brother to Ladillaus the late king refufed it. Thefe infances of magnanimity had fuch an effect on the neighbouring people, that the fates of Lower Lufatia made a voluntary furrender of their country to him. But as Lufatia was a fief of Bohemia, the king of that country immediatcly made war on the elector, in order to recover it. However, he was fo far from being fuccefsful, that, by a treaty of peace concluded in 1462 , he was obliged to yield the perpetual fovereignty of Corbus, I'eits, Sommerficld, and fome other places to the elector. Frederic then, having redeemed the New Marche from the Teutonic order for the fum of 100,000 forins, and fill further enlarged his dominiens, refigned the fovercignty in 2469 to his brother Albert, furnamed Acbillis.
Fxploits of Albert was 57 years old when his brother refigned Alierc fur- the electorate to him. Moft of his exploits, for which ramed A- he had the furname of Acbillts, had been performed chalke. while he was burgrave of Nuremberg. He declared war againft Lewis duke of Bavaria, defeated, and took him prifoncr. He gained eight battles againft the Nurembergers, who had rebelled and contefted Lis rights to the burgraviate. In one of thefe he fought fingly againt 16 men, till his people came up to his anfitance. He made limelf matler of the town of Grieffenburg in the fame manner that Alexander the Great took the capital of the Oxydrace, by lcaping from the top of the walls into the town, where he defended himfelf fingly againf the inhabitants till his men forced the gates and refcued bim. The confidence which the emperor Frederic III. placed in him, gained him the direction of almolt the whole empire. He commanded the Imperial armies againft Lewis the Rich duke of Bavaria; and againt Charles the Bold duke of Burgundy, who had laid fiege to Nuis, Lut concluded a peace at the interpofition of Albert. He gained the prize at 17 tournaments, and was never difmounted.

Prufia and
Eranden. burg united.

All thefe exploits, however, had been performed befure Albert obtained the electorate. From that time we mest wih no very important tranfactions till the year 1594, when John Sigifmund of Brandenburg, having married Anne the only daughter of Albert duke of Pruffia, this united that duchy to the electorate, to which it has continued to be united ever fince; and obtained pretenfions to the countries of Juliers, Berg, Cleves, Marck, Ravenfburg, and Ravenftein;
the fuccefifon of which Anne was heirefs.
Sigifmund died in 1619, and was fucceeded by his fon George Willian; during whofe government the electorate fuffered the molt miferable calamities. At this time it was that the war commenced between the Proteftants and Catholics, which lafted 30 years. The former, although leagued trgether, were on the point of being utterly deftroyed by the Imperialifts under the command of Count Tilly and Wallenttein, when Guntavis Adolphus of Swelen turned the fcale in their favour, and threatened the Catholic par:y with utter - Seceswe deftuation *. But by lis death at the battle of Lat zen, the fortune of war was once more changed. At batt, however, peace was conciuded with the emperor; and, in 1640 , the elector died, leaving his du-
minions to his fon Frederic William, furnamed the Great.

This young prince, though only 20 years of age Reign of at the time of his acceffion, applied himfelf with the Frederic utmoft diligence to repair the loffes and devaftations William occafioned by the dreadful wars which had preceded. the Great He reccived the inveftiture of Prufia perfonally from the king of Poland, on condition of paying 100,000 florins annually, and not making truce or peace with the cnemies of that crown. His envoy likewife received the inveltiture of the electorate from the emperor Ferdinand III. The elector then thought of recovering his provinces from thofe who had ufurped them. He concluded a truce for 20 years with the Swedes, who evacuated the greateft part of his eftates. He likewife paid 140,000 crowns to the Swedith garrifons, which Atill polfeffed fome of his towns; and he concluded a treaty with the Heffians, who delivered up a part of the duchy of Cleves; and obtained of the Holtanders the evacuation of fome other cities.

In the mean time, the powers of Europe began to be weary of a war which had continued for fuch a length of time with fuch unrelenting fury. The cities of Ofnaburg and Munter being chofen as the moft proper places for negociation, the conferences were opened in the year 1645 ; but, by reafon of the multiplicity of bufinefs, they were not concluded till two years after. France, which had efpoufed the interefts of Sweden, demanded that Pomerania fhould be ceded to that kingdom as an indemnification for the expences whith the war had coft Guftavus Adolphus and his fucceffors. Although the empire and the elector refufed to give up Pomerania, it was at laft agreed to give up to the Swedes Hither Pomerania, with the inles of Rugen and Wollin, alfo fome cities; in return for which ceflion, the bifhoprics of Halbertadt, Minden, and Camin, were fecularized in favour of the elector, of which he was put in poffeffion, together with the lordhips of Hochenftein and Richenitein, with the reverfion of the archbifhopric of Magdeburg. This was Treaty of the treaty of Weftphalia concluded in 1648 , and which Weftphalis ferves as a bafis to all the poffefions and rights of the concluded, German princes. The elector then concluded a new treaty with the Swedes, for the regulation of limits, and for the acquittal of fome debts, of which Sweden would only pay a fourth; and next year the electorate, Pomerania, and the duchies of Cleves, were evacuated by the Swedes.
Notwithfanding all thefe treatie, however, the The elecSwedes foon after invaded Pomerania, but were en tor fuctirely defcated by the elector near the town of Fehr- cects bellin. Three thoufand were left dead on the \{pot, ggainft the among whom were a great number of officers; and a great many were taken prifoners. The elector then purfued his victory, gained many advantages over the Swedes, and deprived them of the cities of Stralfund and Gripfwald. On this the Swedec, boping to oblige the eleftor to evacuate Pomeramia, which he had almolt totally fubdued, invaded Prufia, from L:vonia, with 16,000 men; and advaticing into the country, they burned the fuburbs of Memel, and took the cities of Tilfe and Infterburg. The elector, to oppofe the invaders, left Berlin on the toth of January 1679, at the head of 9000 men. The Swedes retired at his approach, and were greatly harafied by

## PR U

the troops on their march. So fuccefsful indced was the clector on this occafion, that the Swedes loft almoft one half of their army killed or taken prifoners. At laft, having croffed the bay of Frifch-half and Courland on the ice, he arrived on the 19 th of January, with his infantry, within three miles of lilfe, where the Swedes had their head-quarters. 'The fime day, his gencral, T'rcfenfeldt, defeated two regiments of the enemy near Splitter; and the Swedes who were in Tilfe abandoned that place, and retired towards Courland. They were purfued by General Gortz, and entirely defeated with fuch flaughter, that farce ing all thefe victorics, the elector being preffed on of the other fide by the vidorious generals of France, with M. Turenne and the prince of Conde, was obliged to make peace with the Swedes. The condirinns were, that the treaty of Weftphalia thould ferve for a bafis to the peace; that the elector fhould, have the property of the cuttoms in all the ports of Further Pomcrania, with the cities of Camin, Gartz, Grieffenburg, and Wildenbruck : on his part, he confented to give up to the Swedes all that he had conquered from them, and to give no affiftance to the king of Denmark, upon condition that France delivered up to him his provisces in Weltphalia, and paid him 300,000 ducats, as an indemnification for the damages done by the French to his ftates. This treaty was fyled the peace of St Germain.

With the treaty of St Germain terminated the military exploits of Frederic William, who paffed the lalt years of his adminiftration in peace. His great qualities had rendered him refpected by all Europe, and had even been heard of in Tartary. He received an embalfy from Murad Geray, cham of the Tartars, courting his friendlhip. The barbarian ambaffador appeared in fuch tattered clothes as farce covered his nakednefs, fo that they were obliged to furnifh him with other clothes before he could appear at court. His interpreter had a wooden nole and no ears. In 1684 , Frederic received into his dominions great numbers of Proteftants who fied out of Erance from the perfecutions of Louis XIV. after he had revoked the edict of Nantz. Twenty thoufand of them are faid to have fettled at this time in the electorate, where they introduced new arts and manufactures, that were of the utmolt benefit to the country. By this, however, he difobliged Louis XIV. for which reaton he concluded an alliance with the emper $r$; and having furnithed him with 8000 tronps againt the Turks in Hungary, the emperor yiclded to him the circle of Schwibus in Silefia, as an equivalent for all his rights in that province.

In 1683, the elector Frederic William died, and tains was fucceeded by his fon Frederic III. This prince of was remarkably fond of fhow and ceremony, which, during the courfe of his government, involved him in much expence. The regal dignity feemed to be tlie greatelt object of his ambition. To obtain this, he joined with the emperor in the alliance againlt France, in which he was engaged by William IlI. king of Britain. He alfo yielded up the circle of Schwibus, which had been given to his predeceffor; and, in 1700 , obtained from the emperor that dignity which he had fo earneftly delired. The terms on which it was ob-
tained were, 1. That Frederick fhould never feparate Prufis. from the empire thofe provinces of his dominions which depended on it. 2. 'Lhat he fhould not, in the emperor's prefence, demand any other marks of honour than thofe which he had hitherto enjoycd. 3. That his Imperial majefty, when he wrote to him, thould only give him the title of Ryal Dileaion. 4. That neverthelefs the minifters which he had $2 t$ Vienna fhould be treated like thofe of other crowned heads. 5 . That the elector fhould maintain 6.00 men in Italy at his own cxpence, in cafe the emperor fhoul 1 be obliged to make war on acconnt of the fucceflion of the houfe of Bourbon to the crown of Spain. (\%. That thofe troops fhould continue there as long as the war lafted.

Thus was the kingdom of Prufia eftablifhed through tha friendihip of the emperor, with whom Frederic I. fo called as being the firt king of Pruflia, continued all his life in ftrict alliancc. Indeed he was a pacific prince and though contemptible in his perfon, and incapable of atchieving great things, had this merit, that he always preferved his dominions in peace, and thus confulted the true intereft of his fubjects much more than thofe monarchs who have dazzled the ejes of the world by their military exploits. He was indeed vain, and fond of fhow, as we have already obferved; but had a good heart, and is faid never to have violated his conjugal vow; though it does not appear that he was greatly beloved by his royal conforts (of whom he had three) on that or any other account.

Fiederic I. died in the beginning of 1713 , and was Fredcric 10 . fucceeded by Frederic William. He was in almoft of t'ruffia every thing the reverfe of his father. His difpofitions a martiab were altogether martial ; fo that he applied himfelf en- prince. tirely to the augmentation of his army, and perfecting them in their exercife, by which means they became the moft expert foldiers in Enrope. His foible was an ambition of having his army compofed of men above the ordinary fize; but as thefe could not be procured, he compofed a regiment of the talleft men he could find; and as his officers made no fcruple of picking up fuch men wherever they could find them for his majefty's ufe, the noghbouring flates were frequently offended, and a war was often likely to enfue even from this sidiculous caufe. However, his Pruflian majelty was never engaged in any martial enterprife of confequence: but having put his army on the molt refpectable footing of any in the world, ard filled his coffers, for he was of a very faving difpofition, he put it in the power of bis fon to perform thote exploits which have been matter of aftonilhment to all Europe.

It was in this king's teign that Prufia firft per- Eumitybeceived her natural enemy and rival to be the houfe of tween Auftria, and not France as had been formerly fippo- bruffia and fed. *Hence frequent bickerings took place between Auftia. there two powers, for which the perfecution of the Proteftants by fome of the catholic ftates of the empirc afforded a pretence; and though a war never actually took place, yet it was eafy to fee that both were mortal enemies to each other. But when Frederic William died in 1740, this enmity broke out in full force. The empreis queen was then left in a very difagreab!e fituation, as has been obferved under the ar- Frederic ticle Britain, $n^{\circ} 410$, \&c. Of this Frederic II. took the Frederic It adxantafe to do himelf juftice, as he fied, with regard letia.

## PRU

Pruffia. to Silicfia, of which his anceftors had been unjuitly deprived. This province he feized at that time: but it colt him de:rr; for the emprefs, having at laft overcome all difficulties, formed againt him the moft terrible combination that ever was known in Europe.

The treaty was hardly concluded with the king of Pruffia, by which fhe reluctantly yielded up the province of Silefia, and with it a clear revenue of L. 800,000 a-year, before fhe cntered into mother cret and feparate articles were added to it. By ene
of thefe it was provided, that in cafe his Pruflian najefty fheuld attack the emprefs-queen, or the cmprefs of Ruffia, or even the republic of Pcland, it thould be confidered as a breach of the treaty of Drefden, by which Silefia was given up. It was alfo ftipulated, that, notwithfanding that treaty (which indeed had beco dictated by the king of Prufia himfelf), the right of the emprefs-queen to Silefia fill continued, and for the recovery of that province the contracing powers fhonld mutually furnilh an army of Go,ozo men. To this treaty, called the treaty of $P_{c-}$ terfourg, the king of Poland was invited to accede; bit he, being in a manner in the power of the king of Prufia, did not think proper to lign it: however, he verbally acceded to it in fuch a manner, that the other parties were fully convinced of his defign to cooperate with all their meafures; and in conlideration of this intention, it was agreed that he fhould have a thare in the partition of the king of Prolia's dominions, in cafe of a fucceffful event of their enterprifes.

In confequence of thefe machinations, every art was ufed to render the king of Pruflia perfonally odious to the emprefs of Ruflia; the queen of Hungary made vaft preparations in Bohemia and Moravia; and the king of Poland, under pretence of a military anmufement, drew together 16,000 men, with whom he occupied a frong poft at Pirna. The queen of Hungary, ftill further to ftrengthen herfelf, concluded a treaty with the court of France at Verfailles, dated May 1: 1756. But in the mean time, the king of Prufia having underfood by his emifiaries what was going forward, refolved to be beforehand with his enemies, and at lealt
ty to keep the war ont of his own country ; and therefore Me invades entered Saxony with a conliderable army. At firl he Baxuny. affected only to demand a free paflige for his trocps, and 212 obiervance of the nentrality profelled by the king of Poland; but, having good reafons to doubt this neutrality, he demanded, as a preliminary, that thefe Saxon troops fhould immediately quit the flrong pof they occupied, and difperfe themielves. This demand was refued ; on which his Pruffian majefty blockaded the Saxon camp at Pirna, refolving to reduce it by famine, fince its flrong fituation rendered an attark very dangerous. At that time there were in Bohemia two Saxom armics, one under the comonand of M. Brown, and the other under M. Picolomini. 'To keep thele in awe, the king had fent M. Schwerin with an army into Liohemia from the country of Glatz, and M. Keith had penetrated into the fame kingdom on the fide of Mifnia. But ftill the king of prulea did not entirely confide in thefe difpolitions;
and thcrefore fearing leaft M. Brown might afford fome affiftance to the Saxons, he joined his forces under Keith, and on December 1. attacked and defeated the an Aufrian general, fo that the later found it impollible $16_{\text {, }}$ to relieve the Saxons, who, after a vain atrempt to re- m, tire from their pof, wee all taken prituners. The ers. king of Poland quitted his dominions in Germany, and the Profians took up their winter-quarteis in Saxony. Here they feized on the revenues, levied exorbitant contributions, and obliged the country to furnifh them with recruits. The king of Pruflid at this time inade himfelf maner of the archives o: Dreflen, by which means he procured the originals of thafe pieces abovementioned, which, when produced to the world, gave a full proof of the combination that had been formed againt him, and confequently juftified the meatures he had taken for his own defence.
No fooner had the king entered Suxony, in the man- He i ner alrcady related, than a procefs was commenced fecui againft him in the emperor's Aulic council, and before the diet of the empire, where he was foon condemned for contumacy, and put to the ban of the empire. - the The varions circles of the empire were ordered to fur- the e nifh their contingents of men and money to put this fentence in execution; but thele came in fo flowly, that, had it not been for the affifance of the French under the prince de Soubife, the army would probably have never been in a condition to act. The Prnd ${ }^{2}$ Auftrians, in the mean time, made great preparations, prepa ${ }^{3}$ and raifed 100,000 men in Bohemia, whom they ccm. tions mitted to the care of prince Charles of Lorrain, affifed gaun by M. Brown. The Czatina fent a body of 60,000 men under M. Apraxin, to invade the Ducal Pruffia; whilf a floong fleet was equipped in the Baltic, in order to co-operare with that army. The king of Sweden alfo acceded to the confederacy, in hopes of recovering the polleflions in Pomerania which his ancefors had enjoyed; and the duke of Mecklenburg took the fame party, promifing to join the Swedilh army with 6000 men as foon as it fhould be neceflary. On the king of Pruflia's fide appeared nobody excepting an army of between 30,000 and 40,000 Hanoverians commanded by the duke of Cumberland ; and thefe were ontnumbered and turced to yield to a fuperior army of French commanded by M. D'Etrees.

In the mean time, his Prufian majefty, finding He in that he mult depend for aflifance folely on his own Boher abilitics, refolved to make the beft ufe of his time. Accordingly, in the fpring 1757, his armies poured in to Bchemia from two different quarters, while the and
defeat Aunti king himfelf propared to enter it from a third. M. Schwerin entered from Silefia; the prince of Bevern from Laratia, where he defeated an army of 28,000 Aultrians that oppofed his pallage. As the intentions of the king himielf were not known, the Auftrians detached a body of 20,000 nen from their main army to obferve his motions. This was no fener done than the king cut off all communication between the detachment and the main body; and having joined his two generals with incredible celerity, he engaged the AuItrians near Pragne, totally defcated them, took their camp, military chelt, and cannon; but lof the brave general Schwerin, who was hilled at the age of 82, with a colonel's ftandard in his hand. On the Anftrian

a. Ade, M. Brown was wounded, and died in a fhort time, though it is fuppofed more from the chagrin he fuffered, than from the dangerous nature of the wound itiélf.

About 40,000 of the Auftrian army took refuge in Pague, while the reft fled different ways. The city was inflantly invefted by the king, and aill fuccours were cut off. The great number of troops which it contained rendered an attack unadvifable, but feemed to render the reduction of it by famine inevitable; however, the king, to accomplifh his purpofe the more fpeedily, prepared to bombard the town. On the $29^{t h}$ of May, after a molt dreadful form of thunder and lightning, four batteries began to play on the city. Frons thele were thrown, every 24 hours, 288 bombs, befides a valt number of red-hot balls, fo that it was foon on fire in every quarter. The garrion made a vigoroas defence, and one well-conducted fally; but had the misfortune to be repulfed with greatlofs. The magifirates, hurghers, and clergy, feeing their city on the point of being reduced to an heap of rubbifh, fupplicated the commander in the moft earneft manner to capitulate; but he was deaf to their intreaties, and drove 12,000 of the moft ufelefs mouths out of town, who were cquickly diven in again by the Pruflians.

Thus the affairs of the emprefs-queen feemed verikes ging to defruction, when Leopold count Daun took upon him the command of the remains of M. Brown's army. This general had arrived within a few miles of Prague the day after the great battie. He immediately colle\{ted the fattered fagitives with the greaten diligence, and retired with them to a frong poft in the neighbourhood, from whence he gave the troops in Prague hopes of a fpeedy relief. It was now the king of Pruffia's bufinefs, either to have attempted to make himfelf mafter of the city by one defperate effort, or entirely to have abandoned the enterprife, and driven count Daun from his poft bef,re his tronps had recovered from the terror of their late defeat; but, by attempting to do both, he rendered himfelf incapable of doing either. Though the army of count Daun already amounted to 50,000 men, and though they were ftrongly entrenched, and defended by a raft train of artillery, his majefly thought proper to fend no more than 32,000 men. ' $\Gamma$ lis body made the arduous attempt on the i $8: h$ of June; but though they did all that human courage and conduct could do, and though the king himfelf at laft charged at the head of his cavalry, the Prufiians wele driven out of the field with great lofs. This engagement was named the battle of Culin.

The firf confequence of the battle of Colin was, that the king of Pruffia was obliged to raife the fiege of Prague; foon after which, he was obliged to quit Bohemiit, and take refuge in Saxony. The Auftrians haraffed him as much as poffible; but, notwichfanding their great fuperiority, their armies were not in a condition to make any decifive attompt upon him, as the frontiers of Saxony absunded widh fituations eafly defended. In the mean time, the Rufians, who had hitherto been very dilatory in their motions, began to exert themfelves, and enter Ducal Pruflia, under M. Apraxin and Fermor, vihere they committed innumerable cruelies and cxeefies. A iarge body of Auftrians cutered Silefia, and penctrated as far as

Breflau. Then they made a tum backwatds, and befieged Scinweidnit\%. Another body entered Lufatia, and made thenfelves minters of Zittau. An army of 22,000 Swedes entered Pruffian Pomerania, took the towns of Anclam and Dcmmein, and laid the whole country under contribution. The French, too, heing freed from all reftraint by the capitulation of the duke of Cumberland at Clofer Seven §, made their way in- $\mathbf{j}$ See Drrto Halbertfladt and the Old Marche of Brandeuburg, taix, $1^{\circ}$ firt cxacling contributions, and then plundering the 447. towns. The army of the empire, being reinforced by that of the prince de Soubife, after many delays, was on full march to enter Saxony, which left the AisAtrians at liberty to exert the greatelt part of their force in the reduction of Silclia. General Haddick Beritula penetrated through Lufatia, paffed by the Pruflian ar- under conmice, and fuddenly appcared before the gates of Ber- tributiou, lin, which city he laid under contribution. He retired on the approach of a body of Pruffians; yet he fill found mems to keep fuch a polt as interrupted the king's communication with Silefa. The deftruction of the king of Pruffia therefore now fecmed inevitable. Every exertion which he liad made, though brave and well-conducted, had been unfucceffful. His general Lchwald, who oppofed the Ruffians, bad orders to attack them at all events. He obeyed his orders; ${ }^{29}$ and with 30,000 men attacked 60,000 of the encmy 1 'ruffian Arongly entrenched at a place called Norkitten. The generaldePrufians behaved with the greatef valour ; but after feated hy having killed five times more of the enemy than they fians. themfelves loft, they were obliged to retire, though more formidable after their defeat than the Ruffans after their vifory. The king, in the mean time, exerted himfelf on every fide, and his enemies fled everywhere before him; but whill he purfued one body, another gained upon him in fome other part, and the winter came on falt, while his Itrength decayed, and that of his adverfarics feemed to increafe on every quarter.
The Pruffian monarch, however, though difteffed, did not abandon himfelf to defpair, or lofe that wonderful prcfence of mind which has fo eminently diftinguifhed him in all his military enterprifes. He indufrioully delayed a decifive action till the approach of winter; but at laft, after varinus movements, on No- The king vember 5. 1757 , he met at Robach with the united gains a. army of his enemies commanded by the prince of Saxe great vicHilburghaufen and the prisice de Soubife. The allied tory at army amounted to 50,000 men complete; but moft of the troops of the Circles were new-raifed, and many of them not well affecied to the caufe. The Pruffians did not exceed 25,000 men; but they were fuperior to amy troops in the world, and were infpired, by the prefence of their king, with the moft entinflaftic ralour. The Arftrians were defeated with the lofs of 3000 killed, eight generals, 250 officers of ditferent ranks, and 6000 private foldiers, taken prifoner:, while night alone prevented the total defruation of the army.

By this battle the king, was fet free or rne fide; but this only gave him an opportunity of renewing his labours on another. The Aultrians had a great force, and now began to make a propostionable progrefs in Siletia. Altera fiege of 16 days, thes had reduced the frong fortrefs of Schweidnit\%, and oblige.?

Pruais. the Prubian garrifon of 4000 men to furrender prifoners of wat. Hearing then of the victory at Rof an of Bevern in his ftrong camp under the walls of Bref trius. lau. They attacked the Prince's army on November 22d; but their attack was fultained with the greatelt refolution. The tlaughter of the Auftrians was pro-
32 Battle with digious. A great past of the enemy had retired from the prones tie field of battle, and the reft were preparing to retire, of Beven, when all at once the Prufinan generals took the fame re folution. Their army had fuffered much in the engagement, and they became apprehenfive of a total defeat in cafe their entrencoments fhould be forced in any fart ; for which reafon they quitted their flrong poit, and retired behind the Oder. Two days after, the prince of Bevern, going to reconnoitre without efoort, attended only by a groom, was taken prifoner by an advanced party of Croats, a fmall body of whom had
croffed the Oder.
33
Breflau tabenly the Aufriats.

Onthis the town of Brenau immediately furrendered; where, as well as at Schweidnit\%, the Auftrians feund great quantities of provifions, ammunition, and money. All Silefia w.is on the point of falling into their hands, and the Prutlian affairs were going iato the utmoft diflraction, when the king himfelf by a molt rapid march palled through Thuringia, Mifnia, and Lufatia, in fpite of the utmoft efforts of the generals Haadick and Marful, who were placed there to oppofe him; and, entering Silefia on the 2 d of December, jomed the prince of Bevern's corps, who repafied the Oder to meet him. The garrifon of Schweidnitz, who, as we have already obferved, had been made prifoners of war, alfo joined the king's army unexpetedly; and their prefence contributed not a little, notwithltanding the fmallnefs of their number, to raife the firits of the

34
Garsifon of
schweidnitz reco ver their libisty. whole army. They had fubmitted to the capitulition with the groateft reluetance; but as the Auftrians were conducting them to prifon, they happened $t 0$ receive intelligence of the victory at Roßach: on which they immediately rofe on the efcort that conduced them, and entirely difperfed it ; and afterwards marching in fuch a diredion as they thought might molt readily lead them to their king, they accidentally fell in with his army.

His Pruffinn majetty now approached Breीau; on which the Auftians, confiding in their fuperiority, (for they exceeded 70, 000 , while the Pruffians fearce amcunted to 36,000 ), abandoned their llrong camp, the fame which the prince of Bevern had formerly oc- cupied, and advanced to give him battle. The bing dis not intend by any mears to difappoint them, but advanced on his past with the grealeft celerity. The two armies met on December 5 th, near the village of Leuthen. Count Daun ma 'e the beit difpofitions prif. fible. The ground occupied by his army was a flain, with finall eminences in fome parts. Thefe eminences they furrounded with artillery; and as the ground was alfo interfperfed with thickets, they fought to turn thefe likewife to their advantage. On their right and left were hills, on which they planted batteries of cannon. The ground in their front was interfected by many caufeways; and to make the whole nore impracticable, the Auftians had felled a great number of trees, and feattered them it the way. It was almolt
impofible at the bejinning of the engagenient for the Prufian cavaliy to att, on account of thefe impediments; but, by a judicious difpofition made by the king himfelf, all difficulties were overcome. His majelty had placed four battalions behind the cavalry of his right wing; furefeeing that Generd Nadafti, who was placed on the enemy's left with a corps de referve, defigned to attack him in flank. It happened as he had fore. feen : that getera's cavahy attacked the Pruffinn ri,ht wing with great fury; but he was received with fuch a fevere fire from the four battal ons, that he was obliged to retire in dilorder. 'The king's flank then, well covered and fupported, was enabled to act with fuch order and vigour as repulfed the encmy. The Auftrian artillery was alfo filenced by that of the Prufians; however, the AuRrians continued to made a gallant refiftance during the whole battle. After laving been once thrown into difurder, they rallied all their forces about Leuthen, which was delended on every lide by entrenchments and redoubts. The Prufians attacked them with the utnoit impetunfity, and at laft became mafters of the poft ; on which the enemy fled on all fides, and a total rout enfued. In this battle the AuAtrians loft 6000 killed on the fpot, 15,000 taken prifiners, and upwards of 200 pieces of camnon.

The confequences of this vietiry were very great. Brefo Breflau was immediately invefted, and furrendered on taken December 29th; the garrilon, amounting to 13,000 men, were made prifoners of war. The blockade of Schweidnitz was formed as clofe $y$ as the feafon of the year would permit; whale detached Pruffian parties over-ran the whole country of Silefia, and reduced every place of lefs importance. The Ruflians, who had ravaged and deftroyed the country in fuch a manner that they could not fubfit in it, thought proper to retire ont of the Pruflian duminions altogether. Thus Ge-swed neral Lehwald was left at liberty to act againtt the driver Swedes; and them he quickly drove out of Pruflian Pumerania, the whole of which country he not only recovered, but alfo fome part of Swedifh Pomerania. Thus the duchy of Meclenburg being left quite expored, the king took ample vengeance on it by exacting the molt fevere contributions of men and money. To complete this monarch's good fortune alfo, the French, who had retired after the battle of Rofbach, were now oppofed by the Hanoverians under Prince Ferdinand, who kept them fo well employed, that, during the reft of the war, the king of Prulia had no more trouble from them. See Britain, $n^{0} 442$.

The beginning of the yeir $175^{8}$ was farourable to $\mathrm{Schwe} 3^{38}$ the arms of his Pruffian majefty. On the 3d of April nitzre he commenced his operations againft Schweidnitz, and taken. pufhed the fiege fo vigorounly, that the place furrendered in 13 days. He then difpofed his forces in fuch a manner as might beft guard his dominions againft his numerous enemies. For this purpofe count Dolna ci mmanded a body of troops on the fide of Pomerani:1; another comfiderable body was polted between Wohlau and Glogau, in order to cover Silefia from the Rufians, in cafe they foould make their inroad that wiy. An army, in a little time after, was formed in Saxony, commanded by the king's brother Prince Henry. 'This army conffted of 30 battalions and 45 fquadrons, and was defigned to make head againft the army of the empire; which, by great ef.
forts made during the winter, and the junstion of a large body of Auftrians, was again in a condition to an, Detween all thefe armies at realy commanication was kept up by a proper choice of polls. Alter the redudion of Schweidnitz, the king having made a thow of invading Bohemia, fuddenly burlt into Moravia, where in a floot time he made himfelf matter of the whole country, and on the $27^{\text {th }}$ of May laid liege to Olmutz the capital. Of this M. Daun was no fooner informed, than he took his route to Moravia through Bohemia: and, though he was not in a condition to riks a battle, nor indeed would have done fo unlets he had had a very confiderable advantage ; yet, by placing himfelf in a ftrong fituation where he conld not be attacked, by haraming the king's troops and cutting of their convoys, he at laft obliged him to abandon the en. teierifz. The king, however, who frequently owed a good part of his fuccefs to the impenetrable fecrecy with which he covered all his defigns, gave not the leaft hint of his intention to raife the fiege of Olmut/. On the contrary, the very day before the fiege was raled, the friogr continued as brifk as ever; but in the night (July 1.) the whole army took the road to Bobemia in two columns, and gained an entire march upon the Auftions. Thus, notwithftanding the utmof efforts of his enemies, the Pruflian army reached Bohemia with very little moleftation. IVerche feiced upon a large magazine at Lieutomifel ; defeated fome corps of Auftrians who had attempted to interrupt his progrefs; and arrived at Konigforatz, of which he took poffeflon, after driving from it 7000 Aultians who were entrenched there. This city and feveral other diftrists he laid under contribution : but foon after en. tered Silefia, and marcloed with the utmolt rapidity to cacomiter the Rumians, who had at that time united their forces under generals Brown and Fermor, entered the New Marche of Brandenburg, and laid liege to Cultrin.

The king arrived at this city at a very critical period. The Rufians had laid fiege to it on the 15 th of Augult; and though they were not well killed in managing artillery, yet, by furious and unremitting difcharges at random, they threw in finch a number of bombs and red-hot balls, that the town was foon on fire in every quarter. Siome of the wretched inhatants were burned; others buried in the ruins of their houfes, or killed by the balls which fell like hail in the ftreets; while many of the furvivors abandoned their habitations, and Aed out of the town on that fide where it was not invefted. The governor did every thing for the defence of the place ; but as the walls were bui't after the cli manner, it was impolibic that the town could have made a defence for any length of time, e!pecially as the principal magazine of the befieged lad been blown up. The avenger of all theefe injuries, however, was now at hand. The kins canse in fight of the Ruflians on the 25 th of Augull, after a march of 56 days, and beheld the country evergwhere defolated, and the villages in flames by the depredations of his cruel cuemy, who had waifed the fiege at his approach, and retired towards a neighbouring village named Zorn onff. At rine n'cleck in the monsing, a moft terrible fire of cammon and mortars poured deftaction on the right wing of the RuCian atmy for two hours without intermillion. The flatghter was fuch as might Voz. XV.
lave been espesed ; but the Rumians ke t their grenod with altonilhing refolution, nsw regiments tith pretlins forward to fupply the places of thofe that fell. Wher the firf line had herel awny all thoir charges, thes tuth. ed forward on the Prufitans with their bayonets; and all at once haefe brave troops, though caccuraged by the pecence of their linge, grase way ard fied beicere at: enemy already half dolcated. The Ruflan genowh ought now to have attacked with their caviry the dif. ordered infintry of their cnemics, wheh wonld have completed the defcat, and in all probability given the: finifhing flroke to the king of Jiuflits affars. 11 as opportunity, however, liey loft but the king was not fo negligent ; for, ly a very rapid and mafterly mootion, he brought all the cavalry of his right wing $w$ the centre, and falling on the luffian foot uncovered by their hurle, and even difordered by hacir own faccets, they puthed them back with moft miferable flugh. tor, at the fame time that the repuled batalions of infrantry, rcturning to the charge, and exafperated st thair late difgrace, rendered the vichory ro longer doubtlus. The Ruflars were now thrown into the mof dreadful conlulion. The wind blew the datt and fmoke into their faces, fo that they could not difinguith friends from foes; they fired on each other, plundered their own baggage which Aood between the lires, ans 1 intoxicated rhemfelves with brandy: the raaks fell in upon one another; and, being thus crammed together into a narrow fpace, the fire of the Prufians had at full and dreadiul effect, while their enemies kept up only a fattered and ineffectual fire, gencrally quite over their heads. Yet even in this difmal fituation the Raniars did not ly ; but fuffered themfelves to be flanghteres. till feven at night, when their generals having caufed an attack to be made on the Prufian right wing, the attention of the enemy was drawn to that quarter, and they had time to retire a little from the field of battle 10 recover their order.

In this engagement, which was called the battic of Zorndorff, the Rufians loft 21,529 men, while that of the Prutians did not excecd 2000. A vaft train of:attillery was taken, torether with the military ched, and many officers of high rank. The confequence was, tha: the Rufian army retreated as fir as Landfperg on the frontiers of Poland, and the king was left at liberty to march with his ufual expedition to the relief of prince Heury of Saxony.

The Prince was at this time forely preffed by M. Opcrations Daun. As foon as the king lad left Bohemix in the of Count manner already related, M. Ditin, confitering that it Daun. would have been to no purpole to foll wo lim, refolved to turn lis arms towards Saxony. Towards that comtry; thereforc, he tonk his route throngh I uiatia, by Zittav, Gorlitz, and Bumtzen. On the 3 d of Septem. ber he invelted the frong fortrefs of Sompeftein; which unaccountably lurrendered, atter a lingle day's refifance, to one of his gencrals named Macguire. He then began to favour the operations of General Latdoha, who had advanced through the Lower Lufatia to the confines of Brandenburg; and, by drawing the attention of the Prnilian forces which were lelt in Silelia to the northward of that duchy, he facilituted the progrefs of the generals Harfel and De Ville in the foutiem parts. The ahen propofed that prince Henty fhould be attacled by the army of the empire, while that of 4K

11:3
riufia. l'ridita;

The Auturians forthd pafs the Elbe, and, falling at the fame time on the Praffans, fecond the attack of the lmperialifts, and cut off the retreat of their enemies from Drefden. The fudjen appearance of the hing of dolur, however, put an end to this plan; general Lat retired towards M. Dam, while that general himelf retired from the neighbourhood of Drefien as far as Zittan. The amy of the empire only kept its ground; pofefing itfle of the flrong pof at Pirna, formelly mentinned, but did not undertake any thing. As for the Swedes, who had directed their motions by thofe of the Ruflians, they no fooner heard of the victory of Zowndorff, than they retreated with much more expedition than they had advanced.
'I'hus the king of Paffia's affairs feemed to be pretty well retrieved, when by one fatal piece of negligence lie was brought to the verge of ruin. M. Daun had joffeffed himfelf of an advantagecus camp at Stolphen, by which he preferved a communication with the army of the empire. On the other hand, the king of Pruffia, laving taken poffeffion of an important poft at Bautzen, extended his right wing to the village of Hochl:irchen, by which he preferred a communication with lis hrother Prince Henry, protected Brandenburg, and was better fituated than he could be anywhere elfe for throwing fuccours into Silefia. The two armies kept a watchful eye on the motions of each other; and as the principal aim of M. Daun was to cut off the king's communication with Silefia, and of the king to cut off M. Daun's communication with Bohemia, a batcle feemed inevitable, though great danger feemed to await that party who thould begin the attack.

In this critical pollure of affairs, the Aultrian general formed a defign of attacking the Pruffian camp in the night. In what manner he came to furprife fuch a vigilant enemy, has never been accounted for; but that fuch a furprife was actually accomplifhed on the 14 th of October, is certain. In the dead of the preceding night, the Auftian army began to march in three columns towards the camp of the king of Pruflia: and though the night was exceedingly dark, and they had a conliderable way to go, they all arrived at the fame time, in fafety, without being difcovered, and withont the leaft confufion; and at five in the morning began a regular and well conducted attack. The Pruffians were in a moment thrown into confufion; Marlla? Keith, one of their beft generals, received two mufket-balls, and fell dead on the fpot. Prince Francis of Brunfwick hat his head hot off by a cammon-ball as he was mounting his horfe; and every thing feemed to annonnce the total dettruction of the army. Still, howcver, the king preferved his wonderful prelence of mind, which indeed he never appears to have loft on any oceafion. He ordered fome detachments from his left to fupport his right wing; but the moment that thefe orders were received, the left iffelf was furioufly attacked. General Ketzow, who commanded in that quarter, repulfed the Auftrians with difficulty, and was not able to afford anf conliderable affifance to the right ; which alone was obliged to fuftain the weight of the grand attack. The Aultrians, in the begimning of the engagement, had driven the Pruffians out of the village of Hochkirchen; and as the fate of the day depeaded on the poffefion of that poit, the lonteft dif-
pute was there. The Prefins made liree bloody and unfuccetsful attacks on the village, on the furth they carried it; but the Autrians continually pouring in frelh troops, at laft drove them out with prodigious fla cheter on all fides. The king then ordered a retreat, which was conducted in good order, without being purfued; h. wever, this blooly action coft him 7000 men, together with a great number of cannon. The Auftians computed their own lofs at 5000 .

His Pruftian majefty, having thus happily efcaped fuch imminent danger, took every pollible meafure to prevent the enemy from gaining any confiderable advantage from his defeat. I'erceiving that the only advantage they wifhed to derive from it was to cover the operations of their armies in Silefin, and that he had now nothing to fear on the fide of Sarons, he largely reinforced his own army from that of Priace Henry, and haftened into Silefia, in order to raife the fiege of Neils, which had been completely invefted on the 4 th of October. On the 24 th of that month, therefore, he quitted his camp, and, making a great compals, 10 a void obtructions from the enemy, arrived in the plains of Gorlitz. A body of the Auftrians hild in vain attempted to fecure this poft before him, and fome who arrived after him were defeated with the lofs of 800 men. From this place the king purfued his march with the utmoft diligence; but was followed by general Laudoln, at the head of 24,000 men, who comftantly lung on his rear, and haraffed his army. The king, however, knowing the importance of his expedition, continued his march without interruption, and fuffered his antagonif to obtain many little advantages without molefation. Daun, however, not content with the oppofition given by Laudohn, fent a large body of horfe and foot by another route to reinforce the generals Karfch and De Ville, who had formed the fiege of Neifs and the blockade of Cofel, while he himfelf pafsed the Elbe, and advanced towards Drefden.

All thefe precautions, however, were of little avail. The generals Karfch and De Ville, notwithftanding their rcinforcement, no fooner heard of the king of Pruflia's approach, that they raifed the fiege of both places, and retired, leaving behind them a confiderable quantity of military fores. The end of the Pruflim monarch's march being thus accomplifhed, he inftantly returned by the fame way he came, and haftened to the relief of Saxony, the capital of which (Drefden) was in great danger from Marfhal Daun. The place was but indifferently fortified, and garrifoned only by $12,000 \mathrm{men}$; fo that it could not promife to hold out long againft a numerons and well-appointed army. It was befides commanded by a large fuburb, of which, if once the enemy got poffefion, all defence of the city muft then be vain. For this reafon N. Schmettau, the Prufian Suburbs 0 governor, determined to fet thefe fuburbs on fire, Drefden which was actually done November soth, with an in-burnt: credible lofs to the iahabitants, as in the fuburbs were carried on moft of thofe valuable manufattures which render the city of Drefden remarkable. This difappointed the defigns of M. Daun; but, though the action was agreeable to the laws of war, and had been executed with all the cantion and humanity of which fuch an action was capable, yet the Auftrians exclaim. ed againft it as a piece of the moft unprovoked and wantou cruelty recorded in hiftory.
fıfter

After the king of Pruflia had approached Drefden, all the Auftrian armies retired into Bohemia, where they took up their winter-quarters, as the king of Preffia did in Saxony. This urhappy country he faid he weuld now confider as his own by right of conqueft. But intead of treating the conquered people as his lawful fubjcis, he oppreffed then in all peffible ways, by levying the moft feverc and exerbitart contribntions, furrounding the exchange with foldiers, and confining the merchants in narrow lodgings on flraw beds, till they drew upon their correfpondents for fuch fums as he wanted.

In 1759, as early as the 23 d of February, the Pruffians commenced their military operations. Gercral Wcberfow marched with a body of troops into Pol.and, where he deftroyed feveral very large magazines belonging to the Ruffians, and returned into Silefia without any lofs on the 18 th of April. In the mean time, by fome movements of the king of Pruffia himfelf, the greareft part of the Aufrian tronps had been drawn towards the frontiers of Silefia. Prince Henry immediately took advantage of this opening, ard on the $15^{\text {th }}$ of April entered Bohemia with his army divided into two columns. One, commanded by himfelf, marched towards Peterfiwade; the other, under general Hulfer, palfed by the towns of Pafber $g$ and Commottau. That commandel by Pince Henry himfelf penetrated as far as Lobofchutz and Leitmeritz; the enemy flying everywhere before them, and burning or abandoning the valt magazines which they had amafed in thefe parts. The body under general Hulfen had a more attive employment. A ftrong pafs at Palberg was defer.ded by a confiderable body of Auflians. General Hulfen, having conducted his ca. valry by another way in fuch a manner as to fall di. rectly on their rear, attacked them in front with his infantry, drove them out of their intrenchments, and totally defeated them with the lofs of a great number killcd , and 2000 taken prifoners, while that of the Pruf. fians did not exceed 70 in killed and wounded. After this exploit they returred into Saxony, with hoftages for the contibutions which they had largely exacted during the courfe of their expedition.

Some other fuccelfes obtained by Prince Henry, cleared the country of Franconia of his enemies; but now the approach of the Ruffians feemed orce more to bring the affuirs of the king of Pruflia to a crifis. Notwithtanding the deftruation of their magazines, they had continued to advance into Silefil, where they were oppofed by Ccunt Dohna; but as the tromps he had uith lim were very far infericr to his enemies, he found it impofible to do more, at leall with any appearance of fuccefs, than to obfreve their mations and harafs them on their march. But this was fo difpleafing to the king, that he difgraced this general, and appointel Wedel to fucceed him, wih irders to attack the Rulnims at all events. To enab'e him, however, in fome meafure to comply with this defpera'e orcicr, he fent him tome einforcenients, which brought his arnay up to rear 30,000 . With thefe, oa the 23 d ni july if 5, Gencral Wedel attacked -0,000 Ruf. frans polled in the molt advantageous marner at Zulich w, and defended by a numerens artillery. Though the Prutians marched on to certain dellruction and difgrace, they fullained the attact's for a long time wita
unparalleled refolution. At laft, howerce, they gave way, and were obliged to retire with the lofs of $+i c o$ killed or taken prifinere, and 3000 swounded.

The confequences of this vietory were, that tie Ruf. The Ruf. fians penetrated into the king's territonies, and ton's Gars coke: polfeflion of the towns of Croflen and Fratikfort on the Crasem Oder, which made it abfolutdy neceffay for the king on cise 11 . to erme in perfons to appore them. Acerodingly, on der. the 4th of Augull, hejeired Wedel with a confidera': body of forces, having lef the greatelt part ch his asm: in Saxony under Piince IIenry. But as Marthal D.turs had fert a brdy of 12,000 hore and $: 8=00$ toot unde: General Laudohn to the affitance (f the Roflims, tha: king fill found himet'f unable to fight thom; an, with this and fome other reinfircemert, theer army nuw amounted to upwards of 90,000 . He therefore recalled General Finck, whom he had Eent into S.xony with 9000 men ; but, with all his rcinforcements, it was found impolible to augnent his army in 50,000 complete. His fitnation, however, was now fo critical, that a battle was unaroidable; and therefore, non the i2th of Augult, with this intcriority of number, the king attacked his enemies itrougly intienched, and defended by a prodigious number of canr.ch. In this action, his prircipal effort was againft the lert wing of th: Ruflian army. He began the attack, accerding to caAton, with a hewy cann made; which having produced the defired effef, he attacked that wing with feveral battalions dipofed in columes. The Ruthen inetrencle Firg of ments were forced with great ilaughter, and 72 pieces Prufia coof cannon were taken. But fill there was a defile to the Red hy be paffed, and feveral redoub:9 which covered the villd ec the rime atof Cunnerfdorf to be maftered. Thefe were attacked cumarswith the fame refolution, and taken one after another. derf. The eriemy made ancther ffand at the village, and che deavcured to preferve their ground there by puthins forward feveral battalions of hor'e and foct: but :hes alio proved unfucceisful; they were driven from pat to poft quite to the laft redoubts. For aplards of tic hours the Pruffans were faccetiful, an! everywher: broke the entmy with prodigious fiughter; drove them from almolt all the ground they had ocutpied $\mathrm{j} s$ fore the battle, took more than hallf their arillery, and fcarce any thing feemed wanting to make the viatory complete. In thefe circumfances, tha king wroteth: following billet to the queen: "Mulam, we have beat the Ruffians from their intrerchments. In two hours expect to hear of a glorious viot ry." Of his victory, however, he deprived himfelf, by an excefive eagen nefs for corqueft. The enemy, defeated almont in every quarter, found their left wing, thitered as it was, to be more ertire than any cticr fatt of theisarmy. Count Soltiknff, the Ruflime genera', Cherefere affembled the remains of his rieht wing, ard, ydthariag as many as he could from his cert:e, reinforced t!! laft, and imade a fland at a redoubt which had been creoted on an advantagerus emirence in a place colled the Yocts burying-5round. All the kins's generals are faid to have been of ofinion, that he ruakt thallow the Rut: firs the peaceable folleflom of this polt. Their army hid a'rendy fufered io much, that it would bive 'xe: impolfib'e for then to have attempted any entarprife of confequence atier the battle; but their artil'ery was fill ramerous, the poit very f:ong, and the lrunfan tricos greatly futizued. Thefe reafoas for a ferw m-

## PRU

reulia. ments had fome weight with the king: but the natural impetuofity of lis temper getting the better of his 1 caton, he led on his wearied troops again and again ; till at laf, when their ftrength was in a man. ner tot.ally exhaufled, they were attacked and utterly routed by the Auftrian and Rulian cavaly, the former (f which had hitherte, remaned quite inctive, and were themere quite frefh, and itreliftible by the entcebled Froftians. 'lhe night, an:l the prudent ufe of fome eminemes, preventad the total delloution of the army; however, their lofs amounted 10 20,000 me:n luiled and wounded. 'The king, when be found the viatory totally lof, fent ano:her billet to the queen, reprollied in the following manser: "Remove fiom Barlin with the royal fanily; let the archives be carfiel to Potflam; the town may make conditions with the cnemy."

Iramediately after this defeat, the king fet himfelf about repairing his loftes with the utmof diligence. In a Jew days every thing was again put in order in his camp. He replaced his artillery from Berlin; recalled Gene. ral Klielt with 5000 men from Pomerania; detacl:ed 6000 from his own army to the defence of Saxony; and with the remainder put himfelf between the Ruffians and Great Glogau, covering that city which had been the chief object of their defigns ; and in fhort, notwithfanding their victory, obliged then to return to Poland without aconmplifling any thing befides the carnage at Cumerfdorif.

The misfortunes of the Pruffian monarch, however, were not at an end. Prince Henry indced, by a moft cxtrasdinary and well-conducted march, entered Sax. ony, which was now totally cucr-run by the armies of the cnemy. At the fame time, frong detacliments having been fent into that country under generals, Finck and Wunfch, the whole wis in a fhort time recovered excent Drefden. Towards"this place Marfhal Daun weired, and in all probability would foon have been obiged to leare Saxony entirely. But the King's impatience could not be liatisfied without cutting off his retreat, and lorcing him to a battie; for which puipofe he fent General Finck with upwards of 12,000 men according to the Pruffimaccount, but 30,000 accord. ing to the Auftians, to feize fome pafles through which M. Daun could only take his route torrards Bohemia. 'ihhis commiffion was cxscuted with great exactnefs; but the Pruffin getieral, hiving probably advanced too far into there defies, and neglected to preferve a communication wih the main army, gave his enemy an opportunity of farrounding him, and at laft forcing him and his whole army to furrender prifoners of war. 'This difafter was foon after followed by ano:her. General 1)irceke vas pofted at the right of the Elte, oppofite to Mefen; but on the approach of a larre body of Au. ilrians, they prepared to retreat over the river into a place where they hoped to be more fecure. Bu: having heen obliged by an hard freft to withdraw thar bridge of boats, a thaw fupervened, when they attempted to lay a bridge of pon:orns, fo that they were again oblised to have recounfe to their boats. In this fituation, their rear-guard was at!acked with great fury by the Auftians, and all the foldiers who comofed it killed or taken. The lofs of the Prufians on this occafion was computed at 3000 men.

The year 1,60 thowed the Prnfian monaret in a more
dangerous fatuation than he had cver yet experierced. Indeed his affairs now feemed the ale gether defperate. His loffes were not to be meafured by the number of the hilled or pifoners, but by armies deftroyed or ta- fituatior ker. Forty generals lad died or been kilied in his the kmg fervice lince the beginaing of, CEober 1756 , exclative Pruflia. of thofe who were wounded or taken prifoners. This of itielf would have been an irreparable lof, had not the very wars which defroyed thefe furnifhed others equally capable of filling their places. But another deficiency, which could not beremedied, fill remained.The king had, by his indefutigable induftry and exertions, fupplied all the deficiencies of men in his armies, but thoy were not the fame men as before. The hardy vetcrans, with whom he had originally taken the fieli, were row no mere, and their places were fupplied by others who had neither the fame experience nor difcipline; fo that now he was obliged to fupply this deficiency by his own genius and hercifm.

Fut whatever ablities the Pruftian monarch might poffers, and though he undoubtedly exerted them to the utmoft, it feemed only to be contending againf fate, and his enemies grained @ill greater and greater advantages. General Laudohn, with whom none but the king limfelf feems to have been able to cope, by a feries of artful movements, drew into a difadvantageous fituation M. Fouquet, one of the Pruflian generals, with a ftrong body of forces. Perceiving it impoffible for them to efcape, Laudohn then made a violent attack on their intrenchments in the dead of the night of June 23 d. The Pruffians made a gallant defence, but at laft were all killed or taken prifoners except about 3c0. Of the Pruflians were lilled 4000 , and 7000 taken prifoners; 58 pieces of cannon, and a great number of coloms, were alfo loft. The victory, how: ever, was dear bought ; for the Auftrians lof above 12,000 men in killed and wounded; whom, however, they could better fpare than the Pruflians, on account of their numbers - This action was called the battle of Laviflout.

Baron I,audolin failed not to improve this victory to the utmoft. He inftantly turned back from Landflut, and fell upon the city of Glatz; which he took in a very flort time, with the garrifon who defended it, confifting of 2000 men. In this place were found 101 pieces of brafs cannon, with immenfe quantities of provifions and military flores. From thence he marched againf Breflau, and immediately invefted it. But, in the mean time, the king of Prullia, whofe motions lad been all this time counteracted by M. Daun in Saxony, marched with his ufual rapidity towards Silefi:1. By this means he drew A1. Daun out of Saxony: and indeed the Autrian general ufed fuch expedition, that he gained two full days on the king. This was no fooner known to his Pruffan majelty, than he returned with the fame expedition that he had advanced, and fat down before Dreflen. Of this M. Daun foon received intelligence, and retmrned alfo. In the mean time, however, the buildings of the city were terribly fhattered by the king's cannon the city were terribly flattered by the king's camon the king
and bombs which continually played on it. His en- Prudia. deavours, however, proved ineffectual to reduce it before the arrival of M. Daun. The fiage had been begun on the $13^{\text {th }}$ of July, and on the $19 t h$ M. Daun appeared within a liague of Drefden. The

## PRU [629 ] <br> rRU

Proflians then redoubled their efforts. They had that day received rciuforcements of heary cann in and mortars, with which they battered the platee incellintly. The cathedral church, New Square, feveral principal frects, and fume palaces, and the noble manufatory cf porcelain, were entirely dellroyed. The fiege was continued till the $22 \mathrm{~d}:$ but, on the night of the $2: 1 \mathrm{ft}$, M. Daun hat thrown 16 battalions into the eity; which renclered it impolfible for the king to continue longer before it with any profper of fuccels. He therefore raifed the fiege, and retired without moleftation, thongh there were three conliderable armies of the eremy in the ncighbourhood. Breflatwas fiercels bombardsd by Laudohn, but the approach of Prince Heaty obliged him to defift from his cnterprife on the sth of Augrith.

But, in the mean time, the fortune of the king feemed likely to be terminated by one fatal ftroke. Finding it imponible for him to earry on a defenfive war, he marched towards Silefia with fuch aftonifhing rapidity, that before the middle of Auguft he had ad. vanced 200 miles, leaving Marfhal Daun with his army - far behind him. This expedition he undertook in order to engage General Laudohn before he could have time to effect a junction with Daun and Lacy, another Auftrian general; which triple union feemed to threaten him with unavoidable delfruction at once. This, however, he found it impolible to prevent: and the three armies, when joined, formed a moft tremendous line of encampments, extending no lefs than 30 Englith miles; at the fame time that every one of their pofts was ftrong, and the commumication between them eafy. The king was ftrongly encamped at Lignitz; and for feveral days employed all his military ikill in attempting to induce one of the bodies to detach itfelf from the reft, or to attack them at fome difadvantage; but without effect. At laft, the Auftrian generals, having maturely weighed alleircumfances, refolved to attack the king's camp itfelf, ftrong as it was; and Mathal Daun, remembering the advantage he had gained at Hochkirchen by an attack in the night-time, refolved to follow the fame plan now. The plan therefore was laid in the following manner. The whole army, as foon as it thould begin to grow dark, was to march from their feveral pofts to fuch fituations as were marked out for each corps: they were to Atrike their tents, but yet to keep up the fires in their camps, and to have the drums beat the tattoo as ufual, by which means thiy had a probability of furprifing the enemy; or it not, they jndged it abfolutely impolfible for him to efcape them, though he fhould be ever fo much on his guard. In what manner the king of Prullia became acquainted with this plan, is not known. His friends atcributed it to his own penetration and knowledge of the Aratagems of war; the Auftrians, to intelligence given him by defercers. But, in whatever way he became acquainted with this defign, $i_{i}$ is certain that he took the moft effectual methods of preverting it. $\Lambda$ s the Auftrian plan was to furround his camp, and this could not de done without the divilien of their army which lue had fo long defired, he refolved to intereept one $c$ ! the parties; and if that flould be difabled irom aeting, he could then more eafily deal with the other two. Thercfore, in the very crening calculated fur
the decifive attack on his camp, he quitted it with the utmon privacy, and took an advantageous polt on the road througth which General Laudohn was to palf. The nature of this poft was luch, that at the fame time that it Atopped the progrefs of L,audohn in fron:, Daun would lie under great difliculties if he fhould attempt his rear; at the fame time that, for his further fecurity, the king frengthened the rear wioh fiveral batteries. As fuon as his army was drawn up, he divided it; leaving his right on the ground where it had been Cormed, to obferve Marflal Daun, and to maintain that $p$ - It ; whilf with his Jcft he turach in order to fall on the corps under General Laudohn. In the mean time, that commander, ignorant of the fate which was awaiting him, advanced with the utmof cxpedition towards the place which had been affigned him, in order to Thare in the glory of defroying the Pruffian monards; when, at threc in the morning, on the 15 th of Augult, a thick fog which covered the ground, fuddenly cleating up, difcovered, like the opening of a great feene, the dieadful front of the Prufian army regularly embattled, and advantageoully pofted. Lau-He defeats dohn, though furprifed, made the beit difpofitions that Gencral circumftances would admit of, and an obftinate engagement enfued ; in which however, he was at lat obliged to yield to the fuperion fkill of his adverfary, with the lofs of $10,0 c 0$ killed, wounded, and prifoners, 82 pieces of eannon, and 23 pair of colours.

The victory, though complete, gave but a partial re. lief to the king of l'umfia. The mof effential fervice it did was the preventing of the Ruflians from joining thefe enomeies which he already had. Count Czermchew had been advancing with 24,000 men, and had even paffed the Oder; but was fo intimidated by this news, that he inftantly repaffed that river on the fame bridges which he had lately built, even though M, Daun fent him a Arong body of troops in order to encourage him to advance. Soon after this battle, the king joined his brother Prince Henry at New Marche; and marched arainft Daun, who had begun to form the bluckade of Sehweidnitz, fell upon a corps under General Beck, made two battalions of Croats prifoners, and di'perfed the reft, which obliged the enemy to abandon the enterprife they had juft undertaken. About the fame time, General Halien gained a confiderable advantage over the Imperial army in Sasony, with very trifling lofs on his part, by which he efiectually prevented them from cutting off his communication with the city of Torgau.

By thefe fuecefles the affairs of his Prufian majeity feemed to revive: but there was no end of his enemies. The late mancouvies had drawr him fo far into Silefia, that his communication with Brandenburg was almoft wholly cut off. The Ruflian army, which after it had repafled the Oder began to move out of Silefia, fent forward a powerful detacliment under Count Czernichew towards the march of Brandenburg. A body of 15,000 Auftrians, under the generals Lacy and Brentano, and the whole united body of Auftrians and Imperialifts which acted in Suxony, began their march in concert with the Rufians, and propoled to unite at the gates of Derlin. Thefe armies amounted to 40,000 men. 'I'o oppofe this formidable power, general Hulfen called to his affitance general Wemer, who had been fent with a body of trocps into Pome-

Rerlin ta-
ken ly th Autrians and Rupfians.
rania; but, after being joined by him, their united forces
were found not to exceed 15,000 or 16,000 men. To attempt a defence of the capital with this force would have been little fhort of madnefs: and therefore thefe commanders were obliged to leave Berlin to its fate; which indeed, confidering the barbatity of the Ruffians and the animofity of the Auftrians, feemed to be a dreadful one. However, by the powerful mediation of feveral foreign miniters, the town obtained terms which were not altogether intolerable; but the magazines, arfenals, and founderies were deflroyed, and an immenfe quantity of military fores feized with a number of cannon ard other arms. The city was firft obliged to pay 800,000 guilders, after which a contribution of $1,900,000$ crowns was laid on: yet, notwithfanding his, many violences were committed, and the king's palace was plundered and the fummore abufed in a fcandaleus manner.

The combined armies ftaid in Berlin only four days; dreading the levere vengeance of the king of Prufia, who they heard was advancing towards that place with great expedition. But fo great were the embarrafsments which now attended that monarch, that it feemed abfolutely beyrand human power to retrieve his al. fairs. The Imperialifts, on their return from Berlin, laving no army to oppofe them, mate themfelves maiters of Leipfic, Torgau, Meiffen, and Wirtemberg; in which laft city they found the grand magazine of the Prullians immenfely fored with provifions, ammunition, Ecc. M. Stainville alfo, with a detachment from Broglio the French general's army, laid the city and duchy of Halberftadt under contribution. In Eaftern Pomerania, the Rullians had belieged Colberg by fea and land. In the Weltern Pomerania, the Swedes advanced with great celerity, hoping to thare in the plunder of Berlin. In S lefil, the kirg no fooner began his march to the northward, than Laudolan advanced, and laid liege to the important fortrefs of Cotel ; and, to complete this diflrels and embarraffment, the king himele was attended at every ftep by Count Daun with a fuperior army well prepared to take every advantage.

Inthis defperate fituation the king, being joined by his generals Hulfen and prince Eugene of Wittemberg with the corps under their commard, advanced up the Elbe, while M. Daun fell back to cover Leipfic and Torgau: but the latter, finding that the Prufians directed their march towards the Elbe, encamped within reach of Torgatu; one part of his army extending to the Elbe, by which he was covered on that file, whilf on the other he was covered by hills and woods, fo that it was impofible to choote a more advantageous fituation. The Prullian arniy did not amount to 50,000 men, whilft that of the Auftrims exseeded 86,000: yet fuch were the nioroturate circamfances of the king, that he was obliged to fight under all thefe dfulvant. ges; and therefore he caufed his army to be in formed, that he was now to ead them to a molt defperate attempt, that hisathirs requiced it, and that lie was determined to conquer or die. His fo!diers unanimouny declared that they woth die with him.
'lhe 3 d of November 1,60 was the dity on which this important atfar was decided. The king divided luis forces into three culimns. General Hulfen wis to take foll with ore in a wood that lay on the iele of the Authian ar:ny, and had orders a to move until he
found the ref of the Pruffians engaged. General Ziethen was to charge on the right ; and the great attack in front was to be conducted by the king in perfon. His forces were difpofed in fuch a manner, that either his right or left muft take the enemy in rear and clofe thens in, fo as to difable them from undertaking any thing againft the part where he intended to effect his principal attack. On the other hand, M. Daun perceiving the king to be ferious in his defign of fighting, to prevent confufion, fent all lis baggage over the Elbe, acrofs which he threw three bridges in cafe a retreat fhould be necelfary. At the fame time he caufed Torgau to be evacuated; and then, extending his firft line to a village called Zinne on the left, he fretched it to another called Crofwitz on the right ; fupporting the right of his fecond line upon the Elbe. In this difpofition he was found, when, about two o'clock in the afternoon, the king began his attack. He was received by the fire of 200 pieces of cannon, which were difpofed along the Auttrian front. The Pruflians were thrice led on to the attack ; but were every time repulied and broker with terrible flaughter. The king at length command. ed a frefh body of cayalry to advance, which at firt compelled the Auftrians to retire; but new reinforcements continually coming in, this cavalry was in its turn obliged to fall back, and the Prufians maintained themfelves with extreme difficulty, until General Ziethen, with the right wing, attacked the enemy in the rear, repulfed them, and poffelled himfelf of tome emi. nences which commanded the whole Autrian army. Encouraged by this fuccefs, the Preflian infantry once more advanced, mathered feveral of the enemy's intrenchments, and made way for a new attack of their cavalry, which broke in with irrefiftible fury on the Auftrians, and threw feveral bodies of them into irreparable diforder. It was now about $90^{\prime}$ clock, and of confequence botlu armies were involved in thick darknefs; yet the fire continued without intermiffion, and the battalions with a b'ind rage difcharged at one another without diltinguilhing friend from fue. M. Daun received a dangerous wound in the thigh, and was carried from the field, which probably haltened the defeat of his troops. The command then devolred on Count O'Donnell; who, finding the greatelt part of his tronps in dit: order, the night advarieed, and the enemy poifeffed of fone eminences which commanded his camp, and from which it was in vain to think of driving them, ordered a retreat, which was conducted with wondenful order and exactnefs; none wore loft in pafling the bridges, and by far the greater part of their attillery was prelervea. The lofs of the Prufians was eft mated at 10.000 killcd and wounded, and 3000 taken prifoners. That of the Au ti.ms in killed and wounded is not known; but 5000 were taken frifoners, with 216 officers, amongg whon were fourg nerals.

The confonence of the vistory of Torgan was, th.t All s the king recoveted all Susony except D. eflen; asd in ony the mean time Gereral Werner having watched into lowed Pomerania, the Rulians raifed the fiege of Coloerg, and re:ired into Piland, without having effected anf thing further than walling the open combry. Werner thea few to the allihance of Wellern Pomeramia, where he defeated a body of Swedes, and at lat drove them totally cut of the connery. General L.mis han two at, ruptly raifed the llockade of Cotel; and afterwarcis, abond mins

## PR U <br> PR U

abandoning Londhur, he retired inte the Auftian si-
lefia, leaving th. Pullian fart entirely in quiet M. 1). aun placed one part of his arniy in 1)refden, and the ather in fane ithong polls which lic to the fonth and weft of it, by which he commanded the Elbe, and preferved his communication with Bohemia. The army of the empire retired into Franconia, and placed its heedquarters at Bamberg.

Though thete fucceffes had, to appearance, retieved the king's affairs in fume meafure, jet his Atrength fecmed now to be wholly exhautled; and in the campaign of 1761 , he made no fuch vigorous cflorts as he had formerly done. The Rufians, dividing thamflves into two bodies, invaded Silefia and Pomerania. In the former country they laid fiege to Breflau, and in the latter to Colberg. Tottleben alfo, who had commanded the Rullian armies, was now removed on a fitipicion that he had correfponded with the king of Pruffia, and general Rnmanzow put in his place ; by which it was expected that the Rullian operations would be more brifk this ycar than formerly.

The king continued frongly encamped near Schweidnitz ; wherche was fo clofely watched by generals $\mathrm{D}_{\text {dun }}$ and Laudohn, that he could attempt nothing. However, he defeated the defigns of the Ruflians againft Bre. ilau, by fending general Platen to deftroy their magazines; which he accomplifhed with great fuccefs, at the fame time cutting off a body of 4000 of their troops. But this only brought the more fure defruction upon Colberg; to which place the body of Rulians immediately marched, cruelly wafting the country as they went along. The king of Pruflia could do nothing but fend detachments of fmall parties, which, though thcy could not oppofe their enemies in the field, yet he hoped, by cutting off the convors of the enemy, might diftrefs them to fuch a degree as to oblige them to abandon the fiege, or at lealt protract it till the feverity of the winter thould render it impofible for them to carry on their operations. Thus he weakened his own army fo much, that it was found requifite to draw 4000 - men out of Schweidnitz in order to reinforce it; and no fooner was this done, than general Laudohn fudden1y attacked and took that fortrefs by a coup de main. Colberg made a brave defence; but the troops fent to its relief being totally unable to cope with the Ruffian army confifting of 50,000 men, it was obliged to furrender on the 3 d of December; and thus the fate of the Pruffian monarch feemed to be decided, and almoft every part of his dominions lay open to the invaders.

In the midit of thefe gloomy appearances the ems. prefs of Ruffia, the king's moft inveterate and inflexible enemy, died on the 2d of January 1762. Her fucceffor, Peter III. inflead of being the king's enemy, was his mof fanguine friend. As early as the 23d of February, in a memorial delivered to the minifters of the allied courts, he declared, that, "in order to the eftablifhment of peace, he was ready to facrifice all the conquefts made in this war by the arms of Ruffia, in hopes that the allied courts will on their parts equally prefer the refforation of peace and tranquillity, to the advantages which they might expect from the continuance of the war, but which they cannot obtain but by at continuance of the effufion of human blood."-This addrefs was not fo well relifhed by the allies: however, Liey were very willing to make peace, provided it was
for their own intereft; but they recommended to his attention fidelity 10 :icatics, which conftitutes a mo lefs valuable part of the ingal charakter, than humanity and difintercfedncts. 'This antwer made no impreflion on the czar; a fuspenfion of homilities took place on the 1 Gth of March, which was followed by a treaty of alliance on the 5 th of May. In this treaty the czar fipulated nothing in favour of his former confederates; on the coatrary, he agieed to join his troops to thofe of the king of Prufia, in order to act againft them. Sweden, which had for a long time acted under the direction of Rulian counfels, now followed the example of her miftreis, and concluded a peace with Pruffid on the 22d of May.

It is not to be fuppofed that the ling of Pruffits would remain long inacive after fuch in unexpected turn in his favour. His arms were now cverywherc attended with fuccefs. Prince Henry drove the Imperialifts from fome important pofts in Suxony, by which he fecured all that part which the Pruffians puffelfed; and though the Auftians frequently attempted to re. cover thefe pofts, they were conitantly repulfed with great flaughter. The king was not joined by his new allies till the latter end of June; after which he drove M. Daun befnse him to the extremity of Silefia, leaving the town of Schweidnitz entirely uncovered, and whic:! the king immediately prepared to invelt. In the mean time different detachments of Prufians, fome on the fide of Saxony, and others on that of Silefia, penetrated deep into Bohemia, laid many pasts of the cuunery under contribution, and fpread an univerfal alarm. A confideral,le body of Rufian irregulars alio made an irruption into Bohemin, where they practifed on the Auftians the fame cruclties which they had long been accuftomed to practife on the Pruffians.

But while the king was thus making the beft ufe of his time, he was all at once threatened with a fatal reverfe of fortune by a new revolution in Rufia. The emperor was depofed, and his depofition was foon after followed by his death. The emprefs, who fucceeded him, fufpected that her hufband had been mifled by the counfels of his Pruflian majefty, againft whom, therefore, the entertained a mortal ennity. She could not, Lowever, in the very beginning of her reign, undertake again a war of fo much importance as that which had beea jult concluded. She therefore declared her intention of obferving the peace concluded by the late emperor; but, at the fame time, of recalling her armics from Silefia, Prulfia, and Pomerania; which indeed the unfetcled fate of the kingdom now made in fome degree necoflary. At the fame time a difoovery was made with regard to the king of Pruffia himfelf, which turned the fale greaty in his favour. The Kufian fenate, flaming with refentment againft this monarch, and againtt their late unfortunate fovereign; and the cm . prefs, full of fufpicion that the conduct of the latter might have been influenced by the councils of the former, fearched eagenly amongft,the papers of the late emperor for an elucidation or proofs of this point. They found indeed many letters from the Prufian monarch; but in a ftrain abfolutely different from what they had expected. The king had, as far as prudence would permit, kept a referve and diftance with regard to the ton rafh advances of this unhappy ally ; and, in particular, counfeiled him to wndertake nothing againft

Pruflia.

69 volution in Ruffia.

## PRU [ 632 ] PRU

Yrufla. the cmprefs his confort. The hearing of thefe letters read is fuid to have had fuch an effect upon the emprefs, that fhe burf into tears, and expreffed her gratitude towards the Prulfian monarch in the warmett terms. Still, however, the Ruflian army was ordered to feparate from the Prufians; but all the important places which the iormer had taken during the whole war were faithfully reltored.

The king, finding that the Ruflians were no more to take an adive part in his favour, refolved to profit by their appearance in his camp; and therefore, the very day after the ouder for their return had arrived, he attacked the Auldian army, and drove their right wing from fome cminences and villages where they were advantageoully pofted; by which means he entirely cut of their communication with Schweidaitz, fo that nothing could be attempsed for its relie!. Prince Henry liept them in continual alarms for Bohemia; and a great part of their atention, and no fmall part of their forces, were engaged on that fide. Marthal Daun, now 68 finding himelf endered almon incapable of undertaGenern! king any thing, detached general Laudohn, with a Laudohn force very much fuperior, to attack the prince of Be-
immediately difributed lands to his difbanded foldiers, and gave them the horfes of his artillery to aflift them in their cultivation. By his wife and prudent management, the horrors of war were fonn forgot; and the country was quickly in as flontifhing a tate as crer. Notwithfanding this pacific difpolition, however, the king never flackened his endeavours for the defence of his country, by kceping a refpeqable army on foot; which might be able to act on the lealt emergency.

In the year 1778, a new difference with the houfe of $A$ Audria tork place, concerning the duchy of Bavaria. c But though the moft enormous warlike preparations were made on both fides, and immenfe armies brought into the field, nothing of confequence was effected. even What little advantage there was, feems to have been on the Prullian fide, fince they made themfelves mafters of feveral towns, and kept the war in the enemy's country. However, the emperor acted with fo much caution and fhowed fo much fkill in a delenfive war, that all the manœuvies of his Prufian majefty could gain no material advantage; as, on the other hand, his adverfary was too wife to venture an engagement. A peace therefore was very foon concluded, and fince that time the hiltory of Pruffia, during the remainder of the great Frederic's reign, affords no renarbable event which we have not mentioned in the life of that hero, and in the article Poland. He left his crown to his nephew, whofe character was not then much developed; and it was eafily feen that a new kingdom, which had rilen fuddenly to fuch unexampled power and greatnefs as to excite the jealoufy or apprehenfion of all its neighbours, would require great abilities to preferve it from difmemberment.

The late king had indeed bequeathed the moft effec- State tual fecurities to his fucceffor for the prefervation of natio his dominions, that human wifdom could provide or de- beha vife; by leaving him a full treafury, the fineft army in the world, and a people enthuliaflically attached to his memory and government. The new monarch, with thefe advantages, was not wanting to himfelf. The late king's predilection for the French language and French literature were not grateful to his fuhjects. The prefent fovereign began his reign with declaring in council, "Germans we are, and Germans I mean we thall continne;" giving diredions at the fame time, that their native language thould refume its natural rank and ftation, from which for near half a century it had been degraded by the French. This wats a very popular meafure, and it was followed by another fill more fo. Obferving that he liad marked with great concern the progrefs of impiety and profanerces on the rne hand, and of enthufiafm on the other, he declared, that he wou'd not have his fubjects corrupted either by fanatics or atheifts, and Arietly prohibited all publications tending to excite a contempt or indifference for religion.

Such, on his immediate acceffion to the throne, was the pacific conduct of the monarch, which endeared him to his fubjects, and commanded the approbation of a!l geod men. An opportmsity fon necursed, in He whic! he was the ught to have dit, layed fuch talents the in negotiation and in military arrangements, :as proclum- hon ed hom in every refpect at worthy fucceffor of his uncle. ikat The States of Holland, who had lome been jealous of Hiu the power of the Stadtho!der, and inclined to a tepublican government without any permanent chief, lad giain- ed fuch an afcendency in the flates general, that in 1736 and 1787 they in effect divciced the prince of
 'Dhey procecced even to the feizure and imprifonment of the ptincefs, fifter to the king of Prufia; and depending upon fupport frem France, treated with infolence every power comeded with them in Europe. The court of Berlin did not witners thele proceedings without indignation; and the king formed his plan for reltoring the power of the Stadtholder with fuch ferrecy and prudence, that porhaps nothing could furpars it but the bravery and niniary dill of the duke of Braniwick, by wincm it was carried into excention. In the flort pace ol one motth, that actomplithed general led :S,000 Prutians to Amftedam, and reftored the prerogatives of the prince of Orange. And here, we believe, the riends of the honte of Brandenburg will agrec with us, that our hifrory of Prutiat thould conclude. The monarch's fubt quent conduat has not been fuch ats the begimning of his reign gave reaton to expect. Sunething of it will be feen under the article Poland, and amore mder Revolution and United Provinces; and it is not a fubject upon which we delight to dwell.

The air of Pruffia is wholeiome, ard the foil fruitfu? in grain; afiurding, belides, plenty of pitconl and other fucl. The rivers and laties are well forcd with filh; and amber is found un its coalt towards the Baltic. 'The principal rivers are the Viltula, Bregel, Memel, the Paifarge, and the Elbe ; all of which frequently do damage by their inundations.

The inhabitants of this country were, by Dr Bufching, computed at $6_{35,998}$ perfons capable of bearing arms ; and by another German author, at 450,000 . Since the year 1719 it is computed that about $3+, 000$ colonifts have removed hither from France, $S$ witzerland, and Germany ; of which number one half were Salt\%burgers. Thele emigrants have built 400 fmall villages, II towns, 50 new churches, and founded 1000 villagefchools. The manners of the people differ but little from thofe of the Germans. The eftablithed religions are thole of Luther and Calvin, but chiefly the former ; though almolt all other feets are tolerated.

The late king of Pruftia, by the alfitance of an ex. cellent police, brunght the commerce and manufazures of this country to a very flomifhing fate, which during his life were daily improving. The manufactures of Prullia confill in glafs, iron-work, paper, gunpowder, copper, and brafs-mills; manufactures of cloth, camblet, linen, filk, gold and filver lace, flockings, and other articles. The inhalitants export variety of naval fores ; amber, lint-feed and hemp-feed, oat-meal, filh, mead, tallow, and caviar ; and it is faid that 500 lhips are loaded with thole commoditics every year, chicfly from Koningtberg.

His Prufian majefty is abfolute through all his dominions; but the late king was too wife to opprefs his fubjects, though he availed himfelf to the full of his power. How the prefent fovereign treats them we know not, as the whole of his condud for fonue time pilt has related to the Polith and Freuch revoiutions. The government of this kingdom is by a regency of four chancellors of fate, viz: 1. The great mafter; 2. The great-burgave; 3. The great-chancellor; and, 4 . 'The great-marfhal. There are alfo fome other coun. Vol. XV.
cils, and 37 bailiwicks. The ftate confine, 1 . Ot ceunfellors of thate; 2. Of deputies frem the undility; and, F. Fom the conmuns. Beliwes thete infliutions, the Jate king erceted a board for commere and naviran tion.

His Pruffian majefty, by means of the happy fitua- Revet ues, tion of his commry, its inland navigation, and llee excellent regulations of his predecefior, derives an amating revenue from this country, which, about a consury and at half ago, was the feat o! bours and babatilm. It is faid, that amber alone brings him in 26,000 dollars annually. His other revenues arfe from his demefnes, his Juties of cuttoms and tolls, and the fublidies yearly gramed by the leveral fates; but the exat fum is unt known, though we may conclude that it is very confider. able, from the immenfe charges of the late war.

The military regulations introduced by the late king Military had a wonderfinly quick operation in forming his troopis freagth. and recruiting his anmies. Every regiment has a particular diftriet anigned it, where the young inen proper for bearing arms are regitered; and when occation of fors, they join their regiment, and being incorpurated with vcterans they foon become well dilciplined troops. The Pruflian army, in time of peace, confifts of 175,002 of the belt difiplined troops in the world; and during the lalt war, that force was angmented to 300,000 men.

The royal arms of Pruflia are argent, an eagle dif. Royal plajed fable, crowned, or, for Pruffit: azure, the Im- arms, \&e, perial fceptre, or, for Courland: argent, an eagle difplayed, gules, with femicircular wreaths, for the marquifate of Brandenburg: to thefe are added the refpective arms of the feveral provinces fubject to the Prufflan crown.

There are two orders of knighthood; the firft, that of the Black Eargle, inflituted by Frederic I. on the day of his coronation at Koningforg, with this motto, Suam cuique. The fovereign is always grandmafter; and the number of knights, exclufive of the royal family, is limited to 30 . Next to this is the order of Merit, inftituted by his late majefty; the motto is, Po:rr le merite.

PRUSSIAN blue. See Chemistry-Indent, at Colouring Malter and Prufian Blue.

PRUSSIC Ac1D, according to M. Berthollet, is a Chemical combination of azot of hydrogene and carbon. It appears Amals much lefs akin to acids than to ammoniac ; it has, how- wol, i. 1 . ever, too many properties in common with other acids $\%$, sic. not tus place it in the fame clafs, the sather becanfe our clafiemons are alwags in a degree arbitrary, and onght to be confidered rather as uffful methods, than ats divifions formed by nature. When the Prullic acid is combined with alkali and oxyd of iron, it cannot be fepatated by any other acid, unlefs heat be enployed, or it be expofed to light; and neverthelefs, when it is difengaged by one of thefe means, it cannot feparate iron, even from the weakell acid, unlels it be by it double affinity. It appears that this property is conneeted with the elaftic tate, which is unfavumable to the le combinations: it mut have loft this itate, in other words its specific heat mult be diminithed, in order that it may politis its athmatis with metallic oxyds and allalis. Nitr $n s$ gas, $(x) g . n a t e d$ numatic acid, and fulphurcous acid, preient andlogrous phenomena.

IKYNNE (Wiliarn), an Englifh lawyer, muck 4 I. diltinguithed

I'rufia H Pryanc.

## 1'S A

Prynne
diftinguifhed in the civil commotions under Charles I. was born at Swainfwick in Somerfethire in 1600 . His Hiffriomafix, written againft ftage-plays in 1632, containing fome reflections that offended the court, he was fentenced by the ftar-chamber to pay a fine of 50001 . to ftand in the pillory, to lofe his ears, and to perpetual impriforment. During his confinement, he wrote feveral more books; particularly, in 1637, one entitled Nezus frome Ipfruich, which reflesting feverely on the bifhops, he was again fentenced by the ftar-chamber to another fine of 50001 . to lofe the remainder of his ears in the pillory, to be branded on both cheeks with S. L. for feditious libeller, and to be perpetually imprifoncd in Caernarvon cafle. Nothing but cutting off his hands could have prevented Prynne from writing : he wrote 1till; and in 1640, being fet at liberty by the houfe of commons, he entered London in a kind of triumph, was elected into parliament for Newport in Cornwall, and oppofed the bifhops with great vigour, being the chief manager of archbithop Laud's trial. In the long parliament he was zealous in the Prefoyterian caufe; but when the Independents gained the afcendency, he oppofed them warmly, and promoted an agreement with the king. When the army garbled the houfe and refufed him entrance, he became a bitter enemy to them and their leader Cromwell, and attacked them with liis pen fo feverely, that he was again imprifoned : but he pleaded the liberty of the fubject fo fuccefsfully, that he was enlarged, to write niore controverfial books. Being reftored to his feat after Cromwell's death, with the other fecluded members, he affited in promoting the reftoration, and was appointed keeper of the Tower records; a place excellently well calculated for him, and where he was very ufeful by the collections he publifhed from them. He prefented 40 volumes of his works, in folio and $4^{\text {to }}$, to Lincoln's-inn library, of which fociety he was a member; and, dying in 1669, was buried under the chapel.

PRYTANES, in Grecian antiquity, were the prefidents of the fenate, whofe authority confited chiefly in affembling the fenate; which, for the moft part, was done once every day.

The fenate confifted of 500, 50 fenators being elected out of each tribe: after which, lots were caft, to determine in what order the fenators of each tribe fhould prefide ; which they did by turns, and during their prelidenthip were called prytanes. However, all the 50 prytanes of the tribes did not gnvern at once, but one 2t a time, viz. for feven days; and after 35 days, another tribe came into play, and prefided for other five weeks ; and fo of the reff.

PSALM, a divine fong or hymn ; but chiefly appropriated to the 150 Pfalms of David, a canonical book of the Old Teflament.

Mor oi the pfalms have a particular title, fignifying aiber the name of the author, the perfon who was to fet it to mulic or fing it, the infrument that was to be nied, or the fubject and occafion of it. Some have imasined that David was the fole author of the Book of Pfaims ; but the titiles of many of them prove the contrary, as pfalm cx. which appears to have been written by Mofes. Many of the pfalms are infcribed with the nimes Korab, Jelluthin, \&ic. from the perfons who were to ling them.

PSALMANAZAR (George), the fictitious name
of a pretended Formofan, a perfon of learning and in- Fralm, genuity. He was born in France, and educated in a free-fchool, and afterwards in a college of Jefuits, in an archiepifcopal city, the name of which, as likewife thofe of his birth-place and of his parents, are unknown. Upon leaving the college, he was recommended as a tutor to a young gentleman; but foon fell into a mean rambling life, that involved him in difappointments and nisfortunes. His firt pretence was that of being a fufferer for religion. He procured a cerlificate that he was of Irifh extraction, that he left that country for the fake of the Catholic faith, and was going on a pilyrimage to Rome. Being unable to purchafe a pilgrim's garb, and obferving one in a chapel, dedicated to a miraculous faint, which had been fet up as a nonument of gratitude by fome wandering pilgrim, he contrived to take both the ftaff and cloak away; and, being thus accoutred, berged his way in fluent Latin, acculting only clergymen or perfons of figure ; whom he found io generous and credulcus, that, before he had gone 20 miles, he might eafily have faved money, and put himfelf in a much better drefs: but as foon as he had got what he thought was fufficient, he begged no more; but viewed every thing worth feeing, and then retired to fome inn, where be fpent his money as freely as he had obtained it. Having heard the Jefuits fpeak much of China and Japan, he ftarted the wild fcheme, when he was in Germany, of paffing for a native of the ifland of Formofa; and what he wanted in knowledge, he fupplied by a pregnant invention. He formed a new character and language on grammatical principles, which, like other oriental languages, he wrote from right to left with great readinefs; and planned a new religion, and a divifion of the year into 20 months, with other novelties, to credit his pretenfions. He was now a Japanefe convert to Chriftianity, travelling for infruction, with an appearance more wretched than even that of common beggars. He then entered as a foldier in the Dutch fervice: but, fitl defirous of palfing for a Japanefe, he altered his plan to that of bcing an unconverted heathen ; and at Sluys, brigadier Lauder, a Scots colonel, introduced him to the chaplair, who, with a view of recommending hirnfelf to the bifhop of London, refolved to carry him over to England. At Rotterdam, fome perfins having put threwd queftions to him, that carried the air of doubt, he took one more whimfical ftep, which was to live upon raw flelh, roots, and herbs; which ftrange food he thought would remove all fcruples. The bilhop of London patronized him with credulous humanity; and Pfalmanazar found a large circle of friends, who extolled him as a prodigy. Yet were there fome who entertained a jult opinion of him, particularly the Drs Dalley, Mead, and Woodward ; but their endeavours to expore him as a cheat only made others think the better of him, efpecially as thofe gentlemen were efteemed no great admirers of revelation. But in this infance at leat, eafincfs of belief was no great evidence of penetration. He was employed to tranflate the church-catechifm into the Formofan language, which was examined, approved, and laid up as a valuable MS; and the author, atter writing his well-known Hiffory of Formofia, was rewardet and fent to Oxford to fudy what he liked, while his patrons and opponents were learnedly difputing at Loudon on the merits of his work. The learned mamess

## PSA

vered in his hitary, of fuch a niture is to diceredit the whole narration, and faved him the trouble of an open declaration of his impullure ; which however he owned at lengily to lis private fiend. For the remainder of his life, his learning and mgennity enabled him to procure acomortable fupport by his pen; he being concerned in feveral works of ceedit, partieularly The Univerfal IIfforj. He lived irrepronchably for many years, and died in $17 \mathrm{H}_{3}$.

PSALNIIST, in the ehurch of Rome, one of the leflicr eccleliallical orders; the fame with what among us is called clerl, piecen or, or fingor.

P'SALMODY, the art or ade of finging pfalms. See Psalm.

Pfalmody was always efteemed a confiderable part of devution, and ufually performed in the fanding pofture : and as to the manaer of pronunciation, the plain fong was fometimes ufed, being a gentle inflection of the voice, not much different irum reading, like the chant in cathedrals; at other times more artificial compofitions were ufed, like our anthems.

As to the perfons concerned in finging, fometimes a fingle perfonfung alone; fometimes the whole affembly joined together, which was the moft ancient and general practice. At other times, the pfalms were fung alternately, the congregation dividing themfelves into two parts, and finging verfe about, in their turns. There was alfo a fourth way of finging, pretty common in the fourth century, which was, when a lingle perfon began the verfe, and the people joined with him in the clofe : this was often ufed for variety, in the fame fervice with alternate pfalmody.

The ufe of mufical infruments, in the finging of flalms, feems to be as ancient as pfalmody itfelf; the firlt pfalm we read of being fung to the timbrel, viz. that of Mofes and Miriam, after the deliverance of the Ifraelites from Egypt : and afterwards, mufical inftruments were in conftant ufe in the temple of Jernfalem. See Organ.

PSALTER, the fame with the book of plalms. See the article I'salm.

Among the religions in the Popifh countrics, the term pfaller is alfo given to a large chaplet or rofary, confifting of 150 beads, according to the number of pfalms in the pralter.

PSALTERY, a mufical inftument, much in ufe among the ancient Hebrews, who called it nebel.

We know little or nothing of the precife form of the ancient pfaltery. That now in ufe is a flat inftrument, in form of a tapezium or triangle truncated at top: it is frung with 13 wire-chords, let to unifon or octave, and mounted on two bridges, on the two fides: it is ftruck with a plectum, or little iron rod, and fometimes with a crooked fick. Its cheit or body relembles that of a finet. See Nablum and Plate CCCXLIV.

PSAMMETICUS, or PsAmmitichus, a renowned conqueror, who, fubduing is other petty kings of Egypt, became the founder of the kingdom of Egypt, about $670 \mathrm{~B} . \mathrm{C}$. He is memorable likewife for taking the city of Azot, after a liege of 29 ycars; and for difcovering the fources of the river Nile. See Egypt, $n^{\circ} 10$.

PSATYRIANS, a fect of Arians, who, in the
councit of Antioch, held in the year $350, \mathrm{~m}$ intained that the Son wis not like the Father as $t$ ) will ; that lie was taten from nothing, ow made or mothing; and that in God, generation was nut to be diftinguithed liom creation.

PSELLUUS (Mich:wl), a learned Clirinian of the Enfielde rath century, was, by birth, a Comlantimopolitan of lateryoof confular rank, and flourithed under the emperor Con- 1 hatufaItantine Monomatha. Ilis genius and induftry raifed $t^{\text {hy }}$. him tar above the level of ho, cotempordies; and the female hitorian Anna Commena freaks of him as ons who hat ben more indebted for his attainments to his own excellent talent than to the influtions of his preceptors; :dding, that having made himfelf matter of all the wifiom of the Greeks and the Chaldeans, he was jully efteemed the moft leamed man of the age. Thus furnithed, he became the chief inftrutor of the ConAtantinopolitan youth. He was at the fame time the companion and the preceptor of the emperor, who vas for captivated by the ftudies and amuements in which Pfel. lus engaged him, that, according to Zonaras, he neglected the concerns of the empire. The Byzantine hiftorians complain, that the emperor, deluded by the head of the philofophers (the title with which Prellus was honoured), loft the world. Meeting, towards the clofe of his life, with fome difappointment, I'fellus re. tired into a monaftery, and foon afterwards died; the time of his death is uncertain. His works, which have been much celebrated, are, Commentaries upon Aritothe's Logic and I'hyfics; a Compendium of Queftions and Aniwers; and an Explanation of the Chaldean Oracles. The two latter works prove him to have been converfant, not only with Grecian, but with Oriental, philofophy.

PSEUDO, from qiudGo, a Greek term ufed in the compofition of many words, to denote falfe or fpurious: as the pfeudo-acacia, or baftard acacia; pfeudo-fumaria, or battard-fumitory; pfendo-ruta, or baftard-rue, \&c.

We alfo fay, a preudo-apoftle, or falfe apofle; a pfeudo-prophet, or falfe prophet, \&c.

Pseudo-China. See Smilax.
Pseudo-Galena, or Black Fack. See Zinc, and M1neralogy, p. 62 :

Psfudo-Tinea, in natural hiftory, the name of a very remarkable fpecies of infect defcribed by M. Reaumur approaching to the nature of the tinea, or clothes-moth while in the worm-flate, but not making themfelve coats of the fubftance of leaves, cloth, \&c. thongh they form a fort of cafes for their defence againft a very terrible enemy.

Thefe creatures are of the caterpillar kind, and have, in the manner of many of thefe infects, 16 legs. They feed on wax, and for food enter the bee-hives; where they boldly engage the bees, and are not to be prevented by them from feeding, though at the expence of their habitations and the cells of their refervoirs of honey : fo that it is no uncommon thing for a fwarm of bees to be forced to change their place of labitation, and make new combs elfewhere; leaving the old ones to this contemptible victor, whom they know not how to drive out or difpoffefs.

Virgil and Ariftotle, and all the authors who have written on bees, have complained of this deftructive animal. It never eats the honey, but feeds only on the wax; attacking principally thofe waxy cells where

## PSE [ $\epsilon_{3} \sigma$ ] P I

Pruio.
the female bee depofites her eggs for the future proseny.

The becs, who are a match for moft other creatures by means of their ftings, would eafly deffroy thefe weak creatures, were it not for the impervious armour they are covered with. 'They forn thenafelves a coat of armour of a double matter. The firt, which immediately covers the body, is of a kind of filk of their own piming ; and the muter covering over this is of the bees-u:ux : this is laid confiderably thick; and the creature, jult thrufing out its head to feed, goes on devouring the cells undilturbed, while a whole anmy of the in habitants are in vain buzzing about him, and attempting to pierce him with their Itings. He never forfakes his covering, but lengthens and enlarges it as he goes; and gnawing down the lides of the cells in his march, without flaying to eat them one by one, the havock and deftruction le occations are fearce to be conceived. When the time of the change of this creature approaches, it contracts its body within its double covering, and there changes into the nympl! fate; whence, after a proper time, it comes forth in firm of a moch, with graaulated horns and a crooked probofcis.

The bees have cunning enough to know their deftructive enemy in this new form ; and as this is a weak and defencelefs ftate, they attack and deftroy all the mothes of this fpecies they can meet with. 'lhey del. dom are fo fortunate, however, as to kill the whole race as foon as produced; and if only one efcapes, it is able to lay a foundation of revenge for the death of its brethren. All the flies of the moth kind lay a vaft number of eggs, and this is behind hand with none of them in that particular: the young ones produced from the egrs of one furviving female of th: is fecies are fufficient to defroy many honey-combs; nay, many hives of them. The moth produced by this caterpillar flies but little; yet it is very nimble in avoiding danger, by xunning, which it does with great fwiftnefs.

There is a fpecies of thefe pfeudo-tiner, or wateeating caterpillars, which infelt the fubterranecus hives of wafps and other creatures which make wax : the manner of living, feeding, and defending themfelves from their cnemies, is the fame in all the fpecies. Thefe laft, if they are at any time diltreffed for food, will eat their own dang; the wax having paffed almoft unaltered through their borlies, and being laill wax, and capable of affording them more nourilhment on a fecond di. geltion. Thete fpecies, though they naturally live on this folt food, yet if by any accident they meet with harder only, they know how to live upon it; and can cat a way into the covers and leaves of books, and make themfelves cafes and coverings of the fragments of thefe 1 pera. fublances. "ilhe accurate atuthor of thefe obfervamar's Hif tions deleribes allo a kind of peudotinea which feeds
 futctu.
on wool, and alrother that eats leather ; both making ti.nnielves houles alfor of the materials they feed on.

There is ilfo another kind very deftrutive to corn: thefe make themfelves a covering by fattening together it great number of the graine, and there living and eating in fecret. All thele creatures, whatever be their food or habitation, finally become phalcia, or moths; and may te dituguthed, even in this Itate, from the sther fipecies, by hiving gramulated horns of a remarkable frufturc, and all of them a protolcis, or trunt, caso or lefs incurvated.

PSEUDONYMUS, among critics, air author who Pfeudo publithes a book under a falfe or feigned name; as cryptonymes is given to him who publithes one under a difguifed name, and anommous to him who publithee without any name at all.

PSIDIUM, the gUava: A genus of the monogynia order, belonging to the icofandria clafs of plants; and in the natural method ranking under the rith order, Hifperides. The calys: is qninquefid, fuperior there are five petals; the berry is unilocular and monofpermous. Therc are two fpecies: I. The pyriferum, or white guava; 2. The pomiferum, or red guava. Both thefe are thought to be only varieties of the fame plant. The red guavat rifes to the height of 20 feet, and is co. vered with a fmooth bark; the branches are angular, covered with oval leaves, having a ftrong midrib, and many veins running towards the fides, of a light green colour, fanding cippofite upon very fhort foolfalls. From the wings of the leaves the flowers come out upon footfalks an inch and an helf long: they are compofed of five large roundilh concave petals, within which are a great number of famina fhorter than the petals, and tippel with pale yellow tops. After the flower is paft, the germen becomes a large oval fruit fhaped like a pomegranate.

A decoction of the roots of guava is employed with fuccefs in dylenterics: a bath, $f$ a decoction of the leaves is faid to cure the itch and other cutaneous eruptions. Guayava, or guava, is diftinguifhed from the colour of the pulp, into the two fpecies abovementioned, the white and the red; and, from the figure of the fruit, into the round, and the pear-fafhimed or perfumed guava. The latter has a thicker rind, and a more delicate tafte than the other. The fruit is about the bignefs of a large tennis ball; the rind or fkin generdlly of a ruffet ftained with red. The pulp within the thick rind is of an agreeable flavour, and interfperfed with a number of fmall white feeds. The rind, when fewed, is eaten with milk, and preferted to any other flewed fruit. From the fame part is made marmalade; and from the whole fruit is prepared the finen jelly in the world. The fruit is very aftringent, and nearly of the fame quality with the pomegranate; fo fhould be avoided by all who arc fubject to coftivenefs. The feeds are to hard as not to be affected by the fermentation in the ftomaclis of animals; fo that when voided with the excrements, they take root, serminate, and produce thriving trees. Whole meadows in the Wclt Indies are covered with guavas, which have been propagated in this manner. The buds of guava, boiled with barley and liquorice, produce an excellent ftifan for diarrhoas, and even the bloody flax, when not too invetcrate. The wood of the tree, employed as fuel, makes a lively, ardent, and lafting fire.

PsITTACUS, or Parrot, in ornithology; a recnus belonging to the onder of fict. The bill in this genus is hooked from the bate; and the upper mandible is moveable : the netlrils are round, placed in the bafe of the bill, which in fome fpecies is furnifhed with a kind of cere : the tongue is broad, and blont at one end: the head is large, and the crown flat: the legs are thort, the toes placed two before and two behind. It might feem a wonder why nature has deftined to this, which is not naturally a bird of prey, but feeds on fruits and vegctable fubltances, the crooked beak

## 1'SI [ 637 ] PS O

wh. :illoted to the hawk and other carnivorous birds: but dich as are planted with a particular kind of palm, perthe scafon feems to be, that the parrot being at heavy bird, and its legs met very fit for furvice, it climbs up and down thees by the help of this tharp and hooked bill, with which it lays hold of any thing and fecures itfelf before it firs a foot; and belides this, it helps itfelf forward very much, by pulling its body on with this ho!d.

Of all animals, the parrot and crocodile are the only ones which move the upper jaw ; all creatures elife moving the lower only. As fome particular aninals belide are fond of particular foods, to the parrot loves noihing fo much as the feeds of the carthanas, or baItard fuffiron ; and eats them withont any hurt, though they are a purge when given to other cicatures.

P'arrots are found almoft evcry-where within the tropics; and in their natural ftate they live on fruits and feeds, though, when tame, they will eat Alfh, and even fifh.

In the Latt and Wed Indies they are very common, and in fuch warm climates are very biik and lively; here, however, they lofe much of their vigour. They feldom make nefts, but breed like owls in lollow trees; they lay two eggs. At particular times they fly in very large troops; but fill they keep two and two together. This genus confifts of infinite variety, not fo much owing to mixture of fecies, however, as might be fiupoled. They feem to run vafly into one another, to as to appear to be related, though seceived fiom different parts of the world; this, huwever, may pofibly be occafioned by their being carricd frons one place to another for the fake of lale. This uncertainty of native place has prevented Mr Latham from following Buffon's plan, and ranging them according to the places they are fuppofed to inhabit; he divides them therefore into thole with uneven and chofe with even tails.

Buffon ranges the parrots in two great claffes: the firft of which comprehends thofe of the Old Continent, and the fecond thofe of the New. The former he fubdivides into five families, the Cockatoos, the Parrots, properly fo called, the Lorics, the long-tailed Paroquets, and the flort-tailed ones; and the latier into fis, viz. the Macios, the Amit:onians, the Creeks, the Popinjays, the long-tailed Paroquets, and the fhort-tailed ones.

Mr Latham has increafed the genus from 47 to 163 ; and fince the time he wrote his Index at leaft 20 more have been difcovered. They are vory generally divided into three hinds: b. The larger, whicla are as big as a moderate fowl, called macaos and corke.oons; thete have very long tiils. 2. The middle-fized ones, commonly called parots, which have fhort tails, and are a little larger than a pigeon. And, 3. The fmall ones, which are called parequets, and have long tails, and are not larger than a lark or blach bird.

1. The pfittacus macan, or red and blue macao, is red, except the wing quills, which above are b!ue, below rafous: the fcap:lir feathers are variegateh with blue and green : the cheeks are raked and wrinkled. It is about two feet feven inches and a halflong, and about as big as a capon. Kdwards fays, when perteet, it will meafure a full yard from bill to tail. It inhabits Blafil, Guiana, and other parts of South America. It was formerly very common in St Doming?, but is now rarely found there. It gencrally lives in moit woods, cfirecially
haps what is called the macaw trce. It does not in gencral learn to fpeak, and its voice is particularly rough and difagrecable. The flth is hard, black, and unfavoury, but mases guod foup, and is much afed by the imhabitants of Cayeme and other places. This fipecies, in common with other parrets, is dinbect to fits when tamed; and though it will live for many ycars thougla the returns be pretty frequent, it gencrally falls a victina to that diewe at latl. The Americans call it gonzalo. 2. The pfittacus ararauna, or blue and yellow macaw, is bluc above, and yellow below, and the cheeks are naked, witin featbery li.cs. It is about the fame fize with the lalt, and inhabits Jamaica, Guiana, Brafil, and Surinam. 3. The pfittacus feverus, or Brafilian green macaw, is black, with at greenifla fplendor; the bill and eyes are reddifh, and the legs are yellow. It is about one foot and five inches lons, and is common in Ja:maica, Guidna, and Brafil. It is however comparatively rare; but it is cxtremely beantiful, and of a very amiable and fociable temper when familiar and acquainted; but it can meither bear ftrangers nor rivals : its voice it not flrong, nor does it articulate very diftincly the word ara. See Plate CCCCXVI.
2. The pfittacus aurora, or yellow amazon, is abont 12 inches long, of a green colour, with blue wing quills, and a white iront; its orbits are fnowy. It inhabits Mcxico or 13rafil; but in all probability the latter, from the one which Salerne faw, and which pronounced Portuguefe words. The pfittacus guineenfis, or gellew lory, is ahout ten inches long, and is an inhabitant of Guinea. The bill is of a black colour ; the cere, the throat, and fpace about the eyes, are white; above the cye there is a patch of yellow, and the relt of the head and neck is crimfon. The breaft is yellow, wing coverts green, and the quills are blue, edged with yellow. Under the wings, belly, thighs, vent, and to the under part of the tail, the colour is white, which laft is tipped wilh red; the legs are dufky, and the claws black. See Plate CCCCXVI.
3. The pfittacus pullarius, red-headed Guinei parraket, or Guinea fparrow, is about five inches and a half long. It inhabits Guinea, and is found in Ethiopin, the Eaft Indies, and the illand of Java, and fometimes in Surinam. It is green, with a red front, fulvous tail, black bar, and cinereous orbits. The male of this fpccies is peeuliarly affectionate to the female. Sec Plate ccccxvi.

In Mr White's Yoarnal of a Voynge to Neeu South Woles, we find a defcription, with excellent engravings, of feveral fpecies of this extenfive genus; and in Governor Philip's Voyage to the fame place, we find defcriptions and prints of feveral of the fime feccies. But the moft particular of the later authors are Buffon and Latham, efpeciaily the lalt ; to whofe extenfive and accurate work we therefore refer our readers for that information which our limits permit us not to give. See his Symopiss, vol. i. p. 19t-323. See allo Liffin, vol. vi. p. $63-245$.

PSOAS, in anatomy. See there, Table of the MFif. clis.

PSOPHIA, in ornithology; a genus belonging to the order gallin.e. The bill is moderate; the upper mandible is convex; the noftrils are oblong, funk, and pervious; the tongus is catilaginous, that, and finged

Prophia, at the end; and the legs are naked a litte above the amd the branches terminated by roundihh heas of blue
l'foralea. knees. The toes are three before and one behind ; the lat of which is fmall, with a round protuberance be-

Plate
ccecxpi. neath $i t$, which is at a little diftance from the ground. Mr Latham only enumerates two fecies: 1 . Pioplia crepitans, or gold-breafted trumpeter. Its head and
brealt are fmooth and fhining green. By the Spaniards of Maynas it is called trompetero, and by the French at Cayenne ajami, under which laft Buffon deferibes it. It inhabits various parts of South Anmerica, Brafil, Guiana, Surinam, \&cc. but it is molt plenty in the A. mazons country. It is about 20 inches long, being about the fize of a laige fowl, and lays egrs rather latrger, of a blue green colour. It is met with in the Carribee illands, where it is called a phecfomt, and its flefh is reckoned as good as that of a pheafint. The molt characierific and remarkable picperty of thefe birds contits in the wonderful noife they make either of themfelves, or when urged by the keepers of the menagerie. Some have fuppoied it to procced from the enus, and fome from the belly. It is now certain, however, that this noife proceeds from the lungs. See Buffon, vol. iv. p. 390, \&c. A nother very remarkable circumftance is, that they follow people through the flrects, and out of town, and that too even perlect ftrangers. It is difficult to get rid of them ; fnr if you enier a houfe they will wait your return, and again join you, though often after an interval of three hours. " I have fometimes (fays M. de la Borde) betaken myfcli to my heels; but they ran falter, and always got before me; and when I ftopped, they ftrpped alfo.I know one (continues he) which invariably follows all the Arangers who enter his maller's houle, accompa. nies them into the garden, takes as many turns as they do, and attends them back again. 2. Plophia undulata, or undulated trumpeter, is ahout the fize of a goofe. The upper part of the body is of a pale red. difh brown colur, beautifully undulated with black. The head is adorned with a dependent creft. On each fide of the neck, beneath the ears, begins a lift of black, widening as it defcends, and neesing on the lower part before, where the feathers become greatly elongated, and hang loofely down. The under parts are generally white, the legs are of a dulky blue co. lour, like the bill. It is a native of Africa: Mr Latham's fpecimen came from Tripuli.
l'SORALEA, in botany: A genus of the decandria order, belonging to the diadelphia clafs of plants; and in the natural method ranking under the 32 d order, Pafitionacea. The calyx is powdered, with callous points, and as long as the monofpermous legumen. The molt remarkable fpecies are, I. The primata or pinnated proralea, rifes with a woody foft ftem, branching five or fix feet high, pinnated leaves of three or four pair of narrow lobes terminated by an odd one, and at the axillas clofe-fitting blue fowers with white keels. It is a native of Ethiopia. 2. The bituminofa, or bituminous trifoliate pforalea, rifes with a fhrubby \{alk, branching fparingly about two or three feet high, with ternate or three-lobed leaves of a bituminous fcent, and blue flowers in clofe heads; it grows in Italy and in France. 3. The aculeata, or aculeated prickly pfordea, rifes with a fhrubby branching ftem three or four feet high, with ternate leaves, having wedgeflaped lobes, terminating in a recurved lharp point,
flowers; it grows in Ethiopia. Thefe plants flower here every fummer; the firlt fort greatelt part of that feafon, and the others in July and Augult; all of which are fucceeded by feeds in autumn. Keep them in pots in order for removing into the green-houle in winter. They are propagated by feeds, fown in a hotbed in the firing ; and when the plants are two or three inches high, prick them in feperate fmall pots, and gradually harden them to the open air, fo as to bear it fully by the end of May or begiuning of June. They may alfo be propagated by cuttings any time in fummer, planted in poss, and plunged in a little heat, or covered clofe with hand ghaties, thaded from the fun, and watered.

PSYCHOTRIA, in botany: A genus of the monogynia order, belonging to the pentandria clafs of plants; and in the natural mo hod ranking under the 47 th order, Stellate. The calyx is quinquedentate, perfiting, and crow ing the fruit ; the corrol a is tubuJated; the berry globole ; with two h:mifpherical fulcated feeds.

The fpecies are four, viz. 1. A patica; 2. Serpens; 3. Herbacea; and, 4. Emetica. They are all natives of Jamaica. See Ipecacuanha.

PSYLLI, (Strabu, Ptolemy): a people in the fouth of Cyrenaica, fo called fron king Pijllus, (A gathargides, quoted by Pliny) : almolt all overwhelmed by fand driven by a fouth wind (Herodotus). They had fomething in their bodies tatal to ferpents, and their very fmell proved a charm againft them, according to Pliny, Lucan, \&c.

Though we may juftly look upon it as fabulons, that there people had any thing in their bodies different from others; it is, however, certain that there are in Egypt at this day fome perfons who have a method of handling the moft poifonous ferpents without any hurt. Of thefe Mr Hallelquilt gives the following account :
"They take the mof poifonons vipers with their bare hands, play with them, put them in their bofoms, and ufe a great many more tricks with them, as I have often feen. I have frequently feen them handle thofe that were three or four feet lorg, and of the moft horrid fort. I enquired and examined whether they had cat out the vipers poifonous teeth; but I lave with my own eyes feen they do not. We may therefore conclude, that there are to this day Piylli in Egypt; but what art they ufe is not cafily known. Some people are very fuperftitious, and the generality believe this to be done by fome fupernatural art which they obtain from invifible beings. I do not know whether their power is to be afcribed to good or evil; but I am periuaded that thofe who undertake it ufe many fuperltitions.
"The art of fafcinating ferpents is a fecret amongft the Egyptians. It is worthy the endeavours of all naturalifts, and the attention of every traveller, $t$. learn fomething decifive as to this affair. How ancient this art is among the Africans, may be concluded from the ancientMarii and Pfyili, who were from Africa, and daily fhowed proofs of it at Rome. It is very remarkable that this fhould be kept a fecret for more than 2000 years, being known only to a few, when we have feen how many other fecrets have withiut that time been re-

## F S Y

realed. The circumftances relating to the falcination of ferpents in Egypt, related to me, were principally, 1. That the art is only known to certain families, who propagate it to their offspring. 2. The perfon who knows how to fafcinate ferpents, never meddles with other poifonous animals, fuch as fcorpions, lizards, \&ec. There are different perfons who know how to fafcinate thefe animals; and they again never meddle with ferpents. 3. Thofe that fafcinate ferpents, eat them both raw and boiled, and even make broth of them, which they eat very commonly amongtt them; but in particular, they eat fuch a difh when they go out to catch them. I have been told, that ferpents fried or boiled are frequently eat by the Arabians both in Egypt and Arabia, though they know not how to fafcinate them, but catch them either alive or dead. 4. After they have eat their foup, they procure a bleffing from their fcheik (prieft or lawyer), who ufes fome fuperfitious ceremonies, and amongft others, fpits on them feveral times with certain geftures. This manner of getting a blefling from the prief is pure fuperfition, and certainly cannot in the leaft help to fafcinate ferpents; but they believe, or will at leaft perfuade others, that the power of fafcinating ferpents depends upon this circuniftance."

Notwithtanding this telimony of Haffelquil, the ftory of the incantation of ferpents, though frequently alluded to in Scripture, has been generally treated as 2 fable. It is, however, affirmed as a certain truth, both by Mr Bruce and M. Savary, "There is no doubt (fays the former of thefe travellers) of its reality. The Scriptures are full of it. All that have been in Egypt have feen as many different inftances as they chofe. Some have doubied that it was a trick; and that the animals thus handled had been firt trained, and then deprived of their power of hurting ; and fond of the difcovery, they have refted themfelves upon it, without experinent, in the face of all antiquity. But I will not hefitate to aver, that I have feen at Cairo (and this may be feen daily without any trouble or expence), a man who came from the catacombs, where the pits of the mummy birds are kept, who has taken a ceraftes with his naked liand from a number of others lying at the bottom of a tub, has put it upun his bare head, covered it with the common red cap he wears, then taken it out, put it in his breaft, and tied it about his neck like a necklace; after which it has been applied to a hen, and bit it, which died in a ferw minutes; and, to complete the experiment, the man has taken it by the neck, and beginning at his :ail, has ate it as one would do a carrot or fock of celery, without any feeming repugnance.
"We know from hiftory, that where any country has bcen remarkably infefted with ferpents, there the people have been fcreened by this fecret.
"To leave ancierit hiftory, I can myfelf vouch, that all the black people in the kingdona of Sennaar, whether Funge or Nuba, are perfectly armed againd the bite of either fcorpion or viper. They take the cerafles in their hands at all times, put them in their bofoms, and throw them to onc another as children do apples or balls, without having irritated them by this ufage fo much as to bite. The Arabs have not this fecret raaturally, but from their infancy they accuuire an exemption from the mortal conequences attending the bite
of thefe animals, by clewing a certain root, and wafhing themfelves (it is not anointing) with an infufion of certain plants in water."
From this account we fhould be apt to think, that thefe vipers really suould not bite any who were thus armed againft their poifon; efpecially as he adds, that he "conftantly obferved, that the viper, however lively before, upon being feized by any of thefe barbarians, feemed as if taken with ficknefs and feeblenefs, frequently hout his eyes, and never turned bis mouth towards the arm of the perfon who held him." Yet in another place, fpeaking of the activity of the ccrafles, he fays, "I faw one of them at Cairo, in the houle of Julian and Rofa, crawl up the fide of a box in which there were many, and there lie Rill, as if hiding himfelf, till one of the people who brought them to us came near him ; and though in a very difadvantageous pofture, fticking as it were perpendicularly to the fide of the box, he leaped near the diftance of three feet, and faftened between the man's forefinger and thumb fo as to bring the blood. The fellow fhowed no figns of cither pain or fear, and even kept him with us full four hours, without his applying any fort of remedy, or feeming inclined to do fo."
It is difficult to fee how thefe two accounts can be reconciled. If thofe who catcl vipers are in danger of being bit by them afier they are catched, certainly they mult be fo before, and then the whole relation becomes contradiftory. Our author tells us, that thefe feats were performed for a feafon, by thofe who were artificially armed againft the viper's poifon, as well as thofe who had the exemption naturally; but though put in poffefion of the drugs, he never had the courage to make the experiment. That he fhould have made fuch a dreadful experiment on bimfelf, no perfon in his fenfes would expect; but it is indeed very furpriting, that he did not attempt by means of thefe medicines to arm fome of the brute creatures, of the lives of which he was fufficiently prodigal, againt the effeets of that deadly poifon by which fo many of them perifhed.As furprifing it is, that he did not try what effeit the root or its decostion would have upon the ferpents themfelves; or that though he fays he had a fmall quantity of this extraordinary root by him, he gave neither drawing nor defcription of it.

Though it is impoffible to reconcile the particulars of this account to one another, the general fact of the incantation is confirmed by the teftimony of M. Savary. This writer tells us, that he faw at the fe.ift of Sidi Ibrahim, a troop of people, feemingly poffelled, with naked arns and a fierce look, holding in their hands enormous ferpents, which twined round their body, and endeavoured to efcape. Thefe Pfylli, grafping them ftrongly by the neck, avnided the bite ; and notwith月tanding their hiffing, tore them with their teeth, and ate them alise, while the blood flreamed from their mouth.
PTARMIGAN, in ornithology. See Tetrao.
PTELEA, shrub-rrefoil: A genus of the monogynia order, belonging to the tetrandria clafs of plants; and in the natural method ranking with thofe of which the order is doubtful. The coroll, is tetrapetalons; the caly $\times$ quadriparite inferior ; the fruit is monofpermous, with a roundifh membraue in the middle.

## PTE

The fpecies are, I. The trifoliata, or Carolina flrubtrefoil, hath a thrabby upright fem, dividing into a branchy head eight or ten feet high, covered with a imooth purplifh bark, trifoliate leavcs, formed of oval fpear-1huped folioles, and the branches terminated by large bunches of greenith-white flowers, fncceeded by roundift, bordered capfules. 2. The vifofia, or vitcous Indian ptelea, rifes with feveral frong thrubby fems, branching erealy 12 or 15 feet high, having a light brown bark, fear-flared, iliff, fimple leaves, and the branclies terminated by clutters of greenilh finwers.

The firt foecics is a hardy deciduous fhrub, and a proper plant for the thrubbery and other ornamental plantations to increafe the variety. It is propagated by feeds, laycrs, and cutings.
the fecond fpecies is a dove-plint, and is propagated commonly by feeds.

PTERIS, in botany; a genus of the order of filices, belonging to the cryptogamia clafs of plants. The fruatifications are in lines under the margin. There ate 19 fpecies; the moft remarkable is the aquilina, or common female fern. The root of this is v frid, naufeous, and bitterifh; and like alt the rett of the forn tribe, has a falt, mucilaginous talte. It creeps under the ground in fome rich foils to the depth of live or fix feet, and is very difficult to be deftroyed. Frequent mowing in patlure-grounds, plentiful dunging in arable lands, but, above all, pouring urine upon it, are the moof approved methods of killing it. It has, however, many good qualities to counterbalance the fow bad cnes. Fern cut while green, and left to rot upon the ground, is a good improver of land; for its athes, if burnt, will yield the double quantity of filt that mont other vegetables will.-Fern is alfo an excellent manure for potatocs; for if buried beneath their roots, it never fails to produce a good crop. Its afthingency is fo great, that it is ufed in many places abroad in drefling and preparing kid and chamois lea-ther.-In feveral places in the noth, the inhabitants mow it green, and, burning it to afhes, make thofe afhes up into balls, with a little water, which they dry in the fun, and make ufe of them to wafh their linen with infead of foap. In many of the Weftern Iftes the people gain a very confiderable profit from the fale of the athes to foap and glafs-makers.-In Glen Eig in Invernefsthire, and other places, the people thatch their houfes with the falks of this fern, and falten them down with ropes made either of bilk-bark or heath. Sometimes they ufe the whole plant for the tame purpofe, but that does not make fo durable a co-vering.-Siwine are fond of the roots, efpecially if boiled in their wafh.-In fome parts of Normandy we read that the poor have been reduced to the miferable neceffity of mixing then with their bread. And in Siberia, and fome other northern countries, the inhabitants brew them in their ale, mixing one-third of the roots to two-thirds of malt. - The ancients ufed the root of this fern, and the whole plant, in decoations and diet-drinks, in chronic diforders of all kinds, ariFing from oblruations of the vifcera and the fpleen. Sone of the moderns have given it a high charaster in the fame intentions, but it is rarely ufed in the prefent prasicc. The country people, however, fill contiwue to retain fome of its ancient ufes; for they give the powder of it to deftoy worms, and look upon a bed
of the green plant as a fovereign cure for the rickets in 1 children.

PTEROCARPUS, in botany: A genus of the decandria order, belonging to the diadelphia clafs of phants; and in the natural method ranking under the 32d order, Papilionacer. The calyx is quinquedentate, the capfule falcated, filiaceous, vaticole. The feeds are few and fulitary. There are four §pecies, viz. 1. Draco ; 2. Ecaflephyllunt; 3. Lunuatus ; and, 4. Santalinus. This lat is by fome referred to the genus Santalum. It is called red funturis; and the wood is brought from the Eaft Indies in large billcts, of a compast testure, a dull red, almolt blackifh colour on the outfide, and :a deep brighter red within. This wood has no manifett fmell, and little or no tafte. It has been commended as a mild aftringent, and a corroborant of the nervous fyftem: but theie are qualities that belong only to the yellow fort.

The prineipal ufe of red faunders is as a colouring drug; with which intention it is employed in fome formulx, particularly in the timbura laventule compofitu. It communicates a deep red to reatifed ipirit, but gives no tinge to aqueons liquors; a fmall quantity of the refin, extracted by means of ipirit, tinges a large one of frefh fpirit of an elegant blood-red. 'There is fearcely any oil, that of lavender excepted, to which it conmunicates its colour. Getffry and others take notice, that the Drazil wonds are fometimes fubitituted for red faunders; ard the college of Druffets are in doubt whether all that is fold anong them for famders be not really a wood of that kind. Acerrding to the account which they have given, their faunders is certainly the Brazil wood; the diftinguilhing eharater of which is, that it imparts its colour to water.

PTEROCOCEUS, in botany, is a fpecies of the genus Calligonum. See Calligovum.

PTERONIA, in botany: A genus of the polygamia equalis order, belonging to the fyngenefia clafs of plants; and in the natural method ranking under the 4 0th order, Compofite. The receptacle is ful of multipartite briflles; the pappus a little plumy ; the ealyx imbricated.

PTEROSPERMUM, in botany: A genus of the polyandria order, belonging to the monodelphia clafs of plants; and in the natural mothod ranking under the 37 th order, Columniferd. The calyx is quinquepartite; the corolla confifts of five oblong fpreading petal:. The filaments are about 15 , which unite towards the bafe into a tube. The ftyle is eylindrical ; the capfuie is oval, woody, and quinquelocular, each of which are biva'ved, containing many oblong, compreffed, and winged feods. There is ouly one fyecies, viz, the Pentaperes, a native of the Eaft Indies; the wood of which is vely hard, and very like that of the holly-trec.

PTINUS, a genus of infects belong:ng to the order of coleoptera. The antenne are filifurm : The laft or exterior articulations are longer than the others: The thorax is nealy round, without a margin, intn which the hend is drawn back or received: The fect are made for leaping. The moft remarkable feccies are,

1. The pectinicernis. This is preduced from a worm that lodges in wood and the trunks of trees, fuch as the willow, where it makes deep round holes, furns to a winged infeat, takes flight, and roolt: upon flowers. It is diftinguifhed by its antemne peatinated on ore
fide, whence it has the name of featbered. The elytra tues and political abilities. He eftablifhed and angmented and thorax are of a deep clay-coloured brown, the antennx and legs are of a pale brown.
2. The pertinax. The form of this infect refembles the preceding one, faving that its antenne are filiform. It is all over of a deep blackih brown colour refembling foot. It attacks houfchold-furniture, cloathes, furs, and efpecially animals dried and preferved in colleations of nstural hiftory, where it makes great havock. When caught, this infect bends its leers, draws back its head, and lies as if it was deal till it thinks itflef out of danger. It cannnt be forced out of this flate of inadion either by pricking or tearing: nothing but a ftrong degree of heat can oblige it to refume its motion and run away. There are many beantiful varieties of this genus; but they in general efcape our attention by their minutenefs, and living among hay, dried leaves, and divers other dully matters, where they undergo their metamorphofes, The barve of fome are found in trunks of decayed trees, in old tables, chairs, \&c. See Plate CCCCXVI.

PTISAN, is properly barley decorticated, or deprived of its hulls, by beating in a mortar, as was the ancient pratice; though the cooling potion obtained by boiling fuch bayley in water, and afterwards fweetening the liquor with liquorice-root, is wiat at prefent goes by the name of Ptijan; and to render it laxative, fome add a little fenna or other ingredient of the fame intention.

PTOLEMAIC Syfem of Affronomy, is that inrented by Claudius Prolemaus. See Ptolemy) Claudius).

PTOLEMAIS, (anc. geng.) ; the port of Arfinoe, fituated on the weft branch of the Nile, which concurs to form the ifland called Nomos Heracleotes, to the fouth of the vertex of the Delta.

Ptolemans (Strabo); the largeft and moft confiderable town of the Thebais, or Higher Egypt, and in nothing foort of Memphis; governed in the manner of a Greek republic; fituated on the weft fide of the Nile, almoft oppofite to Coptos. This town, which was built by Ptolemy Philadelphus, is now known by the name of Polometa. The walls and gates are fill entire, and there are a vall number of Greek inferiptions, but only a few columns of the portico remain. There is likewife an Ionic temple, done in the mofl ancient manser of executing that order, of which Mr Bruce took a drawing, which is preferved in the king's collection.-Another, of Cyrenaica, anciently called Barce.-A third of the Truglodytica, furnamed Epitheras, from the chace of wild beafts, as elephants: lying in the fame parallel with Meroe (Strabo); on the Arabian gulf (Pliny); 4820 fladia to the fouth of Berenice.-A fourth, of Galilee, anciently called Aca, or Acon; made a Roman colony under the emperor Chaudiusi(Pliny).-A fifth of Pamphylin; fituated near the river Melas, on the borders of Cilicia Arpera.

PTOLEMIY (Soter, or Lagus), king of Egypt, a renowned warricr, end an excellent prince: he eftablifhcel an academy at Alexandria, and was himfelf a man of letters. Died 284 B. C. aged 92 .

Ptolemy (Philadelphus), his fecond fon, fucceeded liim to the exclufion of Ptolemy Ceraunus. He was renowned as a conqueror, butmore reyered for his great vir- gun by his father. He greatly increafed the commerce of Egypt, and granted confiterable privileges to the Jews, from whom he oltained a copy of the Old TeRlament, which he caufed to be tranflated into Greek, and depofited in his library. 'This is fuppoled to have been the verfion called the Sepruagiub. He died ${ }^{245}$ years B.C. aged 64.

Prolemy (Ceraunus), the elder brother, fled to Seleucus king of Macedon, who received him hofpitatably ; in return for which he affallinated him, and ufurped his crowa. He then invited Arfinoe, who was his widow and his own fifter, to thare the government with him; but as foon as he got her in his power, he murdesed her and her children. He was at length defeated, killed, and torn limb from limb by the Gauls, 279 B. C.

Ptolemy (Claudius), a celebrated mathematician and aflrologer, was born at Pelufium, and furnamed by the Greel:s Moft Divine and MIft Wife. He flourifhed at Alexandria in the fecond century, under the reigns of Adrian and Marcus Aurelius, about the 138 th year before the Chriftian era. There are fill extant his Geography, and feveral learned works on aftronomy. The principal of which are, I . The Almageft ; 2. De Yudiciiss Afrologicis ; 3. Planifpharium. His fyftem of the world was for many years adopted by the philofophers and aftronomers; but the learned have rejected it for the fyltem of Copernicus. Sce AstroMONY, $1{ }^{\circ} 16$.

PTYALISM, in medicine, a falivation, or frequent and copious difcharge of faliva. The word is Greek, formed from $\pi$ tue " to fpit."
PUBERTY, denotes the age at which a perfon is capable of procreating or begetting children. See Man $\pi^{\circ}$ 13-18.
Puberty, in law, is fixed at the age of 12 in females, and 14 in males; after which they are reckoned to be fit for marriage. But as to crimes and punifhments, the age of puberty is fixed at 14 in both fexes,

PUBES, in anatomy, denotes the middle part of the hypogaftric region in men or women, lying between the two inguina or groins.

- Segion of the Pubes. See Midwifery and SigaulтIAN Operation.
Pubes, in botany, the hair or down on the learos of fome planss. See Hair.

PUBLICAN, among the Romans, one who farmed the taxes and public revenues.

PUBLICATION, the art of making a thing known to the world, the fame with promulgation.

PUBLIUS Syrus, a Syrian mimic poet, who flonriflied about 44 years before Chrif. He was originally a flave fold to a Roman patrician, called Domitius, who brought him up with great attention, and gave him his freedom when of age. He gained the etteem of the moft powerful mear at Rome, and reckoned J. Cxfar among his patrons. He fion eclipfed the poet Laberius, whofe burlefquac compofitions were in general efteem. There remains of Publius, a collestion of moral fentences, written in iambics, and placed in alphabetical order.

Irolen:
11
Publius.

OAy PUCERON, a name given by naturalifsto a very remarkalle fpecies of animal of the puceron kind. They bury themfelves in the clefts of the ouk and fome other trees, and getting into the crevices, where the bark is a litule reparated from the wood, they there live at eafe, and feed to their fill, without being expofed to their common enemies. They are larger than the other puccrons, the winged ones being nearly as large as a common houfe fly; and thofe withont wings are alfo larger than any other fpecies of the famc genus. The winged ones are black, and the others of a coffee colonr. Theit trunk is twice the length of their bodies, and, when walking, it is carried ftraight along the belly, trailing behind it with the point up. When the creature has a mind to fuck a part of the tree that is jult before it, it draws up, and thortens the trunk, till it brings it to a proper length and ditection; but when it fucks in the common way, it crawls upon the inner furface of the bark, and the turned up end of the trunk, which reicmbles a tail, fixes itfelf againft the wood that is belind it, or contiguous to is back, and fucks there. The extremity of this trunk holds fo falt by the wood, that when it is pulled away, it fiequently brings a fmall niece of the wood away with it.

The ants are as fond of thefe as of the other fpecies of pucerons, and that for the fame reafon, not feeding upon them, but on their dung, which is a liquid matter of a fweet talte, and is the natural juice of the tree, very litile altered. Thefe creatures are the fureft guides where to find this fpecies of puceron; for if we at any time fee an number of thefe crawling up an oak to a certain part, and there creeping into the clefts of the bark, we may be aflured that in that place there are quantities of there oak pucerons. The ants are fo extremely fond of the juices of the tree, when prepared for them by palling through the body of this animal, that when the puceron has a drop not yet evacuated, but hanging only in part out at the pafage, an ant will of. ten leize on it there.

Pucerons, I'inefretters, or Plant-lice. See Apris. IUDENDA, the parts of generation in both fexes. See Axatomy, ${ }^{\circ} 107$ and 108.

PUERILITY, in difcourle, is defined by Longinus to be a thought which, by being too far fetched, be. comes flat and infipid. Puerility, he adds, is the common fault of rhofe who affect to fay nothing but what is brilliant and cxtraordinary.

PUFFINDORF (Samuel de) was born in 16 si at Flch, a little village in Mifina, a province in Upper Saxony; and was fon of Elias Puffendorf, minibter of that place. After having made great progrefs in the fciences at Leipfic, he turned his thoughts to the fiudy of the public law, which in Germany confiles of the knowledge of the rights of the empire over the princes and tates of which it is compored, and thofe of the princes and thates with refpet to each other. But though he ufed his utmoll efforts to diftinguifh himfelf, he defpifed thofe pompous titles which are fo much lought for at univeritios, and never would take the degree of doctor. He accepted the place of governor to the fon of Mr Coyet, a Swedifh nobleman, who was then ambatiador from Sweden to the court of Denmark. For this purpofe he went to Copenhagen, but continued not loner at eafe there; for the war being re-
newed fome time after between Demmark and Sweden, $l^{\prime} t$ he was feized with the whole family of the ambaffader. During his confinement, which lafted eight months, as he had no books, and was allowed to fee no perton, he amufed himfelf by meditating on what he read in Grotius's treatife De Jure Bilia ot Pacis, and the poltical writiogs of Mr Hobbes. Out of thefe he drew up a flort fyftem, to which he added fome thoughts of his own, and publifhed it at the Hague in 1660 , under the title of Elententa Jurifprudenti.e Univerfalis. This recommended him to the elector Pala. tine, who invited him to the univerfity of Heidelberg, where he founded in his favour a profeflomflip of the law of nature and nations, which was the firlt of that kind eltablifhed in Geimany. Puffendorf remained at Heidelberg till 1673 , when Charles XI. of Sweden gave him an invitation to be prefeffor of the law of nature and nations at Lunden; which place the elector Palatine relustantly allowed him to accept. He went thither the fame year; and after that time his reputation greatly increafed. Some years after, the king of Swe. den fent for him to Stockholm, and made him his hiforiographer, and one of his counfllors. In 1688 , the elector of Brandenburg obtained the confent of his Swedifh majelty, that he fhould come to Berlin, in order to write the hiftory of the elector William the Great ; and in 1694 made hinn a baron. But he died that fame year of an inflammation in his feet, occafioned by cutting his nails; having attained his grand climacteric. Of his works, which are mumerous, the following are the principal: I. A Treatife on the Law of Nature and Nations, written in German ; of which there is an Englith tranflation wich Barbeyrac's Notes. 2. An Introdaction to the Hiftory of the Principal States which at prefent fubfift in Europe; written in German ; which has been alfo tranflated into Englith. 3. The Hittory of Sweden, frem Guttavus Adolphus's expedition into Germany to the abdication of Queen Chritina. 4 . The Hillory of Charles Guftavus, two volumes folio, \&ic.

PUFFIN. See Alca, $n^{\circ} 3$.
PUGET (Peter Patul), one of the greatef painters and fculptors France ever produced, though but little noticed by their own writers, was born at Marfeilles in 1623 . In his youth he was the difciple of Roman, an able fculptor; and then went to Italy, where be Audied painting and atchitecture. In painting he fo well imitated the manner of Peter de Cortona, that this painter defired to fee him, and entered into a friend. thip with him. In 1657, a dangerous diforder obliged him to renounce the pencil, and devote himfelf to fculpture; and his reputation caufing him to be invited to Paris, he enjoyed a penfion of 1200 crowns, as fculptor and director of the works relating to veffels and galleys. He died at Marfeilles in 1695 , and has left a number of admirable flatues behind him both in France and Italy.

PUGIL, in phyfic, \&c. fuch a quantity of flowers, feeds, or the like, as may be taken up between the thumb and two fore-fingers. It is reckoned the eighth past of the manipulus or handful.

PULEGIUM, or Pennr-Royal. See Mentha.
PULEX, the Flea, in zoology, a genus of infects belonging to the order of aptera. It las two eyes, aud

## I U L

and fix foet fited for leaping; thic fecelers are like tions may be oberered, and parriculariy their way of threads; the roftrum is infeetcd, fetaceous, and arnied with a fing; and the belly is compreffed.

The generation of this faniliar vermin affords fomething very curious, firit difcovered by Sig. Diaciento Cefture. Fleas bring forth eggs, or nits, which they depofit on animals that afford them a proper food : thefe eggs being very round and fnooth, ufiually flip ftraight down; unlefs detained by the piles or other inequalities, of the clothes, hairs, sic. Of thefe eggs are hatched white worms, of a fining pearl colour, which feed on the fcurfy fubfance of the cuticle, the downy matter gathered in the piles of clothes, or other the like fubflances. In a fortnight they come to a tolerable fize, and are very lively and active; and, if at any time difurbed, they fuddenly roll thenfelves into a kind of ball. Sonn after this, they come to creep, after the manner of filk-worms, with a very fivift motion. When arrived at their fize, they hide themfelves as much as poffible, and fin a filken thread out of their mouth, wherewihh they form themelves a fmall round bag, or cafe, white within as paper, but without always dirty, and fouled with duft. Here, after a fortnight's reft, the animalcule burfts out, transformed in. to a perfect flea; leaving its exuvia in the bag. While it remains in the bag, it is milk-white, till the fecond day before its eruption; when it becomes coloured, grows hard, and gets ftrength ; fo that upon its firl delivery it fprings nimbly auray.

The flea, when examined by the microfcope, affords a rery pleafing object. It is covered all over with black, hard, and thelly fcales or plates, which are curioufly jointed, and folded over one another in fuch a manner as to comply with all the nimble motions of the creature. Thefe fcales are all curioufly polifhed, and are befet about the edges with fhort fpikes in a very beautiful and regular order. Its neck is finely arched, and much refembles the tail of a lobfter: the head alfo is very extraordinary ; for from the fnout-part of it there proceed the two fore-legs, and between thefe is placed the piercer or fucker with which it penetrates the 1 lin to get its food. Its eyes are very large and beautiful, and it has two fhort horns or feelers. It has four other legs joined all at the breaft. Thefe, when it leaps, fold fhort one within another; and then, exerting thcir foring all at the fame inftant, they carry the creature to a furprifing diftance. The legs have feveral joints, and are very hairy, and terminate in two long and hooked fharp claws. The piercer or fucker of the flea is lodged between its fore-legs, and includes a couple of darts or lancets ; which, after the piercer has made an entrance, are thruft farther into the flefh, to make the blood flow from the adjacent parts and occafion that round red fpot, with a hole in the centre of it, vulgarly called a flea-bite. This piercer, its fheath opening fidewife and the two lancets within it, are very difficult to be feen; unlefs the two fore-legs, between which they are hid, be cut off clofe to the head : for the flea rarely puts out its piercer, except at the time of feeding, but keeps it folded inwards; and the beft way of feeing it is by cutting off firn the head, and then the forelegs, and then it is ufually feen thruft out in convulfions.

By keeping fleas in a glafs tube corked up at both ends, but to as to admit frefh air, their fevcrad ac-
coupling, which is performed tail to tail; the female, which is much the larger, Atanding on the male They may alfo be hus feen to lay their eggs, not all at nice, but ten or twelve in a day, for fever.l days fuccefiively; which erges will be afterwards found to hatch fucceffively in the fame order. The flea may cafily be diffected in a drop of water; and by this means the foomach :und bowels, with their periRaitic motion, may be difcovered very plainly, as alfo their tefles and penis, with the veins and arteries, though minute bejond all conception. Mr Licuwenhock affirms alfo, that he has feen innumerable animalcules, thaped like ferpents, in the femen mafculinum of a flea. 'This blood-thirfty infeat, which fattens at the expence of the human frecies, prefers the more delicate ikin of women; but preys neither upon epileptic perfons, nor upon the dead or dying. It loves to neftle in the fur of dores, cats, and rats. The nefts of river-fiwa!lows are fometimes plentifully fored with them.

Fleas are apterous; walk but little, but leap to a height equal to 200 tinnes that of their own bodyThis amazing motion is performed by means of the elafticity of their feet, the articulations of which are fo many fprings. Thus it eludes, with furprifing agility, the purfuit of the perfon on whom it riots.-Among the memorabilia of fleas, one, they fay, has been feen to draw a fmall filver piece of ordnance to which it was faftence, the firing of the gun nowife daunting its intrepidity. The owner carried it abont in a little box lined with velvet, every now and then placing it on her arm to let it feed; but winter put an end to the heing of this martial flee. Another flea that became flave to an Englifhman, had for its daily and eafy tafk to drag its golden chain and padlock, of the weight of one grain. A third flea ferved as a thrillhorfe to an Englifh artilt, who had made an ivory coach and fix, that carried a coachman with his dog between his legs, a poltilion two footmen, and four infide riders. At Surat fleas, bugs, and other voracious vermin are in fo great veneration, that they have an hofpital endowed, where every night a poor fellow, for hire, fuffers himfelf to be preyed upon. He is faftened naked on a bed, when the feaft begins at his expence. In Turkey there is a fimilar foundation for decayed dogs; an inftitution lefs ridiculous than the other. Mercurial ointment, brimitone, a fumigation with the leaves of penny-royal, or freth-gathered leaves of that plant fewed up in a bag, and laid in the bed, are remedies pinted ont as deftructive of fleas.

PUI EX-Arboreus, in natural hifory the name given by Mr Reaumur to a very large genus of fmall animals. They arc a kind of half-winged creatures: they have granulated antennx; and fome of them, in their molt perfect fate, have complete wings. Thefe are diltinguifhed from the others by the name of muyfca-pule.s or the wing gell-pulex.

The feveral epecies of thefe creatures are of difierent colours: fone are brown, others yellow: but the moft frequent are green. They all feed upon the leaves of trees, which become withered and curled up on their eroding them; and they are fo common, that whercever a leaf of a tree is found curled up, or of a different form from the others, it is highly probable thefe

## P U L

animals are on it, or that it is their work. Among trees the willow and the rofe are the moft infected by them; and among plants, the bean and the poppy. They live a focial life, multitudes of males and females being found together. The females are eafily diftinguifhed from the males, by their being thicker in the body, and having larger bellies.

It is very wonderfil, that of all the known animals of the winged kind, thefe are the only ones which are viviparous. This is eafily feen beyond a poffibility of doubt; for, on examining a clutter of them together, it is a common thing to fee, by the belp of is fmall magnifier, a female in the act of parturition; and the
author* of this account frequently faw the young pulex protruded out, from a pallage near the anus of the female, perfectly furmed. He had fupected this from the total want of eggs among fo numerous a tribe of animals, and from their remarkably ficedy propagation, and was thus convinced of it by ocular demonftration.

They are armed with a tender and fexile proborcis; with which they feize hold of the young thoots of the tree they live upon, twifting the probofis round it. Thefe creatures are always icen naked and expofed, ftanding on the cutfide of the ftalks and leaves, and fucking in their juices for nouriflment with their probofcis. But there is another fpecies of then, which are alike viviparons, and agree with them in all refrects except in their manner of living. Thefe get into the inner fubfance of the leaves, like the worms called afiorrices; and feed on the parenclyma, being defended from all injuries by living between the integuments. In this cafe, the leaves they bury themfelves in become fcabrcus and deformed, and produce a fort of galls; fo that Malphigi erred in fuppofing all the galls of trees to be produced by the animals hatched of the eggs of ichneumon flies; fince thefe animals, which are viviparues, and are of a very different kind from the worms of the ichncumon fies, equally produce them. A temale of the fpecies here treated of has been feen to bring forth feven young ones in a day : and thus from refiding aione in the tubercles which fhe had formed en a leaf, fhe in a little tinue becomes the mother of a rumerous family ; e:ch of which raifes its own tumour or gall on the l:af, which at firt are fmall and round, and of a beautiful red like kermes.

Such of thefe as are of the male ipecies have a certain time of reft, in which they lie buried in a filky matter, and atterwards beconc winged, flying nimbly about ; whereas the females never are able to fly, but remain always half-winged. It is to be oblerved, however, that there is a different fpecies of winged infects frequently found flying about the female pulices, as well as their own males; to that all the fmall-winged infects about them are not to be thought of their own fpecies. Thefe do not greatly differ in tigure; but the one are hamlefs, and the others have llings, and hurt any part of the body on which they fix.

Pul'x siquatious audorums (monoculus fulex of Linneus), in entymology, is a fpecies of the genus Monoculus, which fee. It is a mofl curious infeat of the fize of a flea, and has been noticed by many writers who have examined its parts with accuracy, and is that swhich, unitisg together in vaft numhers, occalions the
beautiful red patches which may be obferved in a dry fummer feafon on hagnant waters, giving rife to reports of water being turned to blood, and in the minds of the lefs informed thought to portend dire events. The other fpecies of the fame genus collect on waters in a fimilar way, and occafion a fimilar appearance, as has been mentioned under the generic name, to which we refer our readers. See alfo Swanmerdam's Book of Nature, P. 39 ; Baker's Employment for the Mricroforese, p. 302. ; Schoeffer's Iion. $I_{\text {rj. }}$; Sultz. Inf. p. $3^{0}$ : De Scer's Inf. vol. 7 . isc. where there are alfo excellent figures of it. We lave given a figure of it magnified and drawn from life: The outward form of the hody, Swammerdam fays, is a kind of fquare; under the eye there is a flarp beak; on the breaft are a kind of arms divided into branclies like the boughs of tiees, and in the abdomen there is a tranfparent fubflance with the legs and tail, and in the hinder part of the body, its legs appear placeil as it were on the middle of the back: The eyes are almoft clofe together, and are reticulated; the beak is tranfparent.

It appears that infects of this tribe are enabled to bear the extremes of heat and cold: for Ray, in ins Hif. toria Infeciorum, p. 41, obferves, that the pulex fucriatilis was met with by Mr Willoughby in a hot bath near Vicenza in Italy the temperature of which was fuch as to prevent any other living therein; and, on the contrary, O. Fabricins, in his Fauna Granlandir, p. 264. mentions the circumance of the ma:yoculus pues being frequently found under the ice in the ftagnant waters of Greenland.

The chego, or pulex minimus, cutem pentrans, $A$ mericanus of Catefoy, is a very fmall animal found in warm climates. It is a very tronblefome infect, efpecially to negrees and fuch as are flovenly or go barefooted. They penetrate the 1 k in, under which they lay a bunch of eggs, which fwell to the bignefs of a fnall pea or tare. They are exceedingly painful; and unlefs great care is ufed in aking them out, they are dangerous. It is about one-fonrth the fize of a common flea; the figure is confiderably magnified. From the mouth iffues a hollow tube like that of a common flea, between a pair of antennæ. It has fix jointed legs, ard fomething like a tail. Under it is one of its eggs, which is fc.ricely vilible to the nak:d eye. Thefe animals are a great nuifance to moft parts of America between the tropics. See Sir Hans Sloane's, Hifory of Famaicu, Introd. p. cxxiv. and vol. ii. 191, 192.

Pulez-Eutirs, a name given by uaturalilis to a fort of worms firquently found on the leaves of trees, where they devour the animals called pulices arlorei.
Oi thefe there are teveral fpecies, which owe their origin to the eggs of different creatures; for there are none of them in their ultimate flate in this their time of feeding. According to the different animals whofe eggs they are hatched from, thefe are of difierent form and fruqure. Some are hexapodes, or endued with fix: feet ; thefe beiong to the beetle-tibc, and finally change into bectles like the parent amimal from whofe eggs they fprung. Others lave no legs, and are produced from the eggs of flies of various kinds. And, finally, others are genuine caterpillars, though fmall; but thefe are the molt rare of all.

The two general kinds are the hexapodes, or beetleworms
worms; and the apodes, or fly-worms. The fly which gives origin to the latt of thefe is a four-winged one; and takes care always to depofit her eggs in a place where there are plenty of the pulices, wifully on the falk or young branches of a tree in the midlt of large familics of them. The worm, as foon as hatched, finds itfelf in the midre of abundance of food, presing at pleafure on thefe animalls, which are wholly defencelefs. The flalks of the deder and wondbine are frequently found covered over with thefe pulices; and among them thete may ufually be found one or more of thefe deftroyers feading at will, fucking in the juices from their bodies, and then throwing away the dry Anins. Befides the worms of this four-winged lly, there is one of a two-winged wafp.fly, very defructive of thefe animals.

PULLEY, in mechanics, one of the five mechanical powers. See Mechanics, P. 739 .
pulmo, the Lungs, in Anatomy. See there, $\mathrm{n}^{\circ} 117$.
pulmonaria, Lungwort: A genus of the monogynia order, belonging to the pentandria clafs of plants; and in the natural method ranking under the 4 Ift order, Ajperifolis. The corolla is funncl-fhaped, with its throat pervious; the calyx is prifmatic and pentagonal. There arefeveral fpeces; of which the moft remarkable is the officinalis, common fpotted lungwort, or Jerufalem cowflip. This is a native of woods and thady places in Italy and Germany, but has been cultivated in Britain for medicinal ufe. The leaves are of a green colour, fpotted with white: and of a mucilaginous tafe, withont any fmell. They are recommended in phthifis, ulcers of the lungs, \&c. but their virtues in thefe difeafes are not warranted by experience.
pulo pinang. See Prince of IVales's Ifland.
PULP, in phatmacy, the flefhy and fucculent parts of fruits extracted by infufion or boiling, and paffed threvgh a fiéve.

PULPIT, an elevated place in a church, whence fermons are delivered. The French give the fame name to a reading-defk.

PULPITUM, in the Grecian and Roman theatres, was a place wlere the players performed their purts. It was lower th in the feena, and higher than the orcheftra. It nearly a:nwered to what we call the fage, as diftinguifued from the pit and galleries.- Pulpitum was alfo a moveable defk or pulpit, from which difputants pronomned their difiertations, and authors recited their works.

PULSE, in the animal economy, denotes the beating or throbhing of the heart and arieries.
Lio dostrine h.ıs been involved in more difficulties than that of pulfes; fince, in giving a phyfological account of them, ohyficians have efpouted quite oppofite fentiments; whilft fome doubt whethacr the pulfe is owing to the fyefole or cialtole; as alio, whether the motion of the leatt and atteries is onc and the fame, for a moment of time.

With segard to motinn, the pulfes are reckoned only four ; \&reat and little, quick and flow. When quicknefs and greatiefs are joined together, it becomes vielent; and when it is little and flow it is called a weak pulfe. They are alfo faid to be frequent and rare, equal and uncqual; but thele are not the effential affections
of motion. Firequency and quicknefs are often confounded with each other. A pulfe is faid to be bard or forf, with regurd to the artery, according as it is tenfe, renitent, and hard, or flaccid, foft and lax: for the difpofition of the arteries contributes greatly to the change of the pulfe; wherefore it fometumes happons, that the pulfe in both arms is not alike whith is very conmon in a hemplexy. Add to thefe a convulive pulfe, which does not procced from the blood, but from the ftate of the artery; and is known by a tremulous fubfultory motion, and the artery feems to be drawn upwards: this, in acute fevers, is the fign of death; and is faiten be the pulfe in dying perfons, which is likewife generally unequal and intermitting. A great pulfe hows a more copious afflux of the blood to the heart, and from thence into the atteries; a little pulfe the contrary.

The pulies of porfons differ aconding to the largenefs of the heart and veffels, the quantity and temperies of the blood, the elantic force of the canals; as alfo with regard to the fex, age, feafon, air, motion, food, fleep, watchings, and paffions of the mind. The pulf is larger and more quick in men than in women; in the bilious and fanguinco-bilious, than in the phlegmatic and melancholic. Thofe who are lean, with tenfe fibres and large velfels, have a greater and a ftronger pulfe, than thore that are obefe, with lax fibres and fmall veffels; whence they are more healthy, robuft, and apt for labour. In children, the pulfe is quick and foft ; in adults greater and more violent. In the old, it is commmonly great, hard, and flow. Labour, motion, and exercife of the body, increare the circulation of the blood, the excretions, and particularly refpiration; reft renders the circulation flow and weak; intenfe feaking increafes the circulation, and confequently renders the pulfe large and quick. In watching, the pulfe is more evident ; in fleep, more flow and languid. After drinking hot things, tuch as coffee and tea, or hot bath-waters, as well as after meals, the pulfe vibrates more quick. But nothing produces a greater change in the pulfe than affections of the mind: in terror, it is unequal, fmall, and contracted ; in joy, frequent and great ; in anger, quick and hard; in fadnefs, flow, fmall, deep, and weak; and in intenfe fudy, languid and weak. With regard to the air, when, after the predominancy of a weft or fouth wind, it becomes north or eaft, the pulfe is ftronger and larger; as alfo when the quickfilver rifes in the barometer. But when the atmofphere is denfe, humid, rainy, with a logg fuuth wind; as allo where the life is fedentary, the flcep long, and the fealon autumnal, the pulfe is lanzuid and fmall, and the perfiritation decreafed. In May it is great fometimes and violent ; in the middle of fummer, quick but weak; in the autumn, flow, foft, and weak; in the winter, hard and great. A draftic purge and an emetic render the pulfe hard, quick, and weak, with lofs of fitength ; chalybeates, and the bark, render it great and robutt, and the comppecxion lively ; volatiles amplify and increafe the pulfe; acids and nitrous remedies refrigerate the hody, and appeafe the pulfe; opiates and the like render it fmall and weak, and decreafe the elanticity of the folids; and poifons render it fmall, contracted, and hatd. When the quantity of the blood is too great, blecding raifes the pulte.
Pulse, is alfo ufed for the ftroke with which any

Pulener. medium is affected by the motion of light, found, \&c. tin, the method is this: Rub a round wooden box all

Iulveriz.- through it.
tion.
Sir Ifaac Newton demonftrates, that the velocities of the pulics in an elaftic fluid medium (whofe elafticity is proportionable to its denfity) are in a ratio compounded of half the ratio of the elaflic force directly, and half the ratio of the denfity inverfely; $f($ that in a medium whofe elaflicity is equal to its denfity, all pulfes will be equally fwit.

Pulse, in botany, a term applied to all thofe grains or feeds which are gathered with the hand; in contradiftinction to coln, \&c. which are reaped, or mowed: or, It is the feed of the leguminous kind of plants, as beans, vetches, \&c. but is by fome ufed for artichokes, afparagus, \&c.
PULTENEY (William), the famous nppofer of Sir Robert Walpole in parliament, and afterward earl of Bath, was defended from one of the molt ancient families in the kingdom, and was born in $\mathbf{1 6 8 2}$. Being well qualificd in fortune, he early procured a feat in the houfe of commons, and diflinguifhed himfelf as a warm partifan againft Qucen Anne's miniftry; whofe errors he had fagacity to detect, and firited eloquence to expofe. When King George I. came to the throne, Mr Pulteney was made fecretary at war, and foon af. ter cofferer to the king's houfchold ; but the good underftanding between this gentleman and Sir Robert Walpole, who then acted as prime minifter, was interrupted in $\mathbf{1 7 2 5}$, on a fufpicions that Walpole was defiyous of extending the limits of prerogative, and of promoting the interefts of Hanover, to the prejudice of thofe of Britain. His oppofition to Sir Robert was indeed carried to fuch indiferiminate lengths, that fome have been of opinion he often acted againft meafures beneficial to the public, merely from perfonal motives. It would be impracticable here to trace his parliamentary conduct: fo it mult fuffice to obferve in general, that he became fo obnoxious to the crown, that in $173^{1}$ the king called for the council-book, and with his own hand flruck out his name from the lift of the privy-counfellors; a procecding that only ferved to infame liis refentment and increafe his popularity. Thus he fill continued to atttack the minifter with a feverity of eloquence and farcafm that worted every antagonift ; fo that Sir Robert was heard to declare, he dreaded that man's tongue more than another man's fword. At length, when Walpole found the place of prime minitter no longer tenable, and refigned in 1741, among other promotions Mr Pulteney refumed his place in the pri-py-council, and was created eali of Bath; a tille purchafed at the expence of that popularity which afterward he naturally enough affected to contemn. In 1760 , toward the clole of the war, he publifhed $A$ Tetter to two Greal $M_{e n}$, recommending proper articies to be infifted on in a treaty of peace; which, though the writer was then unknown, was greatly applated, and went through feveral impreffions. Hc died in 1764 ; and as his only fon died before him, the title became extinct.

FULVERIZATION, the art of pulverizing, or reducing a dry body into a fine powder; which is performed, in fiable bedies, by pounding or beating them in a mortar, \&c.: but to pulverize malleable cnes, ather nacthods muft be taken. To pulverize lead, or
over the infide with chalk; pour a little of the malted metal nimbly into the box; when fhutting the lid, and fhaking the box brikly, the metal will be reduced to powder.

PUMEX, the Pumice-stone, a fubfance frequent1 y thrown out of volcanoes, though there are many which are never known to throw it out. It is very fell of porcs and blifters; in confequence of which it is fpecifically very light, and refembles the frothy flag produced in our iron furnaces. It is of two colours, black and white; the former being that which it has when thrown out of the volcano ; the latter, as Crontedt conjectures, being perhaps faded and bleached. M. Magellan confiders it rather as a volcanic ejection than a volcanic production; and defrribes it as of a white, reddifh-brown, grey; or black colour. It is of a rough and porons confiftence, being made up of flender fibres parallel to each other, and very light, fo that it fwims on water. It frikes fire with fleel, though with difficulty, and feems originally to have been an afbeftos decompofed by the action of fire; but, on obferving the appearance of that glafly flag produced in the ironfurnaces, which entirely refembles the pumice-ftone, and is produced from the calcareous fluxes ufed to promote the fufion of the ore, our author is of opinion that the formation of pumice may be rather attributed to that kind of froth which mult be formed at the top of the melted matters in the volcanic crater. An hundred parts, according to Bergman, contain from 6 to 15 of magnefia, with a fmall proportion of calcareous earth, and the greateft part filex. Another kind of pumice, which feems to be a ferruginous granite altered by fire, has been difcovered by Dolomicu at Stromboli.

Pumice-ftone is ufed in fome mechanical arts; as for rubbing and fmoothing the furface of metals, wood, palteboard, and Itone; for which it is well fitted by reafon of its harfh and brittle texture ; thus foouring and carrying off the little inequalities from the furfaces juft mentioned,

PUMICE-stöne. See the preceding article.
PUMP, an hydraulic machine for raifing water by means of the preffiure of the atmofphere.

It would be an entertaining and not an uninfruc- of th tive piece of information to learn the progreffive fleps ventic by which the ingenuity of man has invented the vari- pump ous methods of raifing water. A prmp mult be confidered as the laft ftep of this progrefs. Common as it is, and overlooked even by the curious, it is a very abftrufe and refined invention. Nothing like it has been found in any of the rude nations whom the reflefs fpirit of the Europeans has difcovered, either in the new continent of America or the iflands of the Pacific Ocean. Nay, it was unknown in the cultivated empire of China at the time of our arrival thacre by fea; and it is fill a ranity everywhere in Afia, in places unfrequented by the Europeans. It does not appear to have been known to the Greeks and Romans in early times; and perhaps it came from Alexandria, where phyfical and mathematical fcience was much cultivated by the Greek fcliool under the protection of the Ptolemies. The performances of Ctefibius and Hero are fpoken of by Pliny and Vitruvius as curious noveltics.

## PUM [ $\sigma_{\neq 7}$ ] PU M

mp. tics (1). It is perhaps not diflicult to trace the feps by which thofe mechanicians were led to the invention. The Egyptian wheel was a common machine all over Afia, and is thill in ufe in the remotalt corners, and was brought by the Saracens into Spain, where it is fill very coinmon urder is ancient name noria. The 1), arith millionarics found in a semote village in the kingdons of Siam the immediate olfspring of the noria (Letires Edifiatite of Curieufes.) It was a wheel turned by an afs, and carrying round, not a flying of earthen pots, but a Atring of wifps of hay, which it drew through a wooden tunk. This rude chain-pump was in frequent ufe for watering the rice fields. It is highly probable that it is of great antiquity, although we do not recollect its being mentioned by any of the Greek or Roman writers. Tl.e Arabs and Indians were pothing lefs than incovators; and we may fuppofe with great fafety, that what arts we now find among them they policfied in very remote periods. Now the ftep from this to the pump is but fhort, though it is nice and refined; and the forcing pump of Ctefibius is the eafielt and moft natural.

Let AB (fig. 1.) be the furface of the water in the well, and D the height where it is to be delivered. Let DC be a long wooden trunk, reaching as deep under water as poffible. Let the rope EF be fitted with its knot of hay F . When it is drawn up through the trunk, it will bring up along with it all the water lying between $C$ and $A$, which will begin to run out by the fpout $D$ as foon as the knot gets to $G$, as far below $D$ as $C$ is below A. All this is very obvious; and it required but little reflection to be affured, that if F was let down again, or pufhed down, by a rod inftead of a rope, it would again perform the fame office. Here is a very fimple pump. And if it was ever put in practice, it behoved to fhow the fapporting power of the atmofphere, becaufe the water would not only be lifted by the knot, but would even follow it. The imperfeation of this pump behoved to appear at firft fight, and to fuggeft its remedy. By puthing down the knot F, which we fhall henceforward call the pifton, all the force expended in lifting up the water between A and G is thrown away, becauie it is again let down. A valve $G$, at the botton, would prevent this. But then there muft be a paffage made for the water by a lateral tube KBD (fig. 2.) And if this be alfo furnifhed with a valve H , tn prevent its lofing the water, we have the pump of Ctefibius, as fketched in fig. 2. The valve is the great refinement: but perhaps even this had made its appearance before in the noria. For, in the more perfect kinds of thele machincs, the pots have a thop or valve in their botom, which hangs open while the
put defecnds with its mouth downwards, and then al-
Риาท!. lows it to fill readily in the ciftern; whereas, wi hone the valve, it would occat.ion a double lad to the whect. If we fuppofe that the valve had made its appearance fo early, it is not improbable that the cominn pump Iketched in fig. 3. was as old as that of Ctefitius. lior a further detcription of the pump of Ctelibius as it was ufed by the ancients, and of thofe pumps which have been deduced from it and are now in common ufe, fee Hydrosiatics $n^{\circ}$ 28-32. In this place we thall nit give a thort defcription of the chief varieties of thefe engines, condidering them in their fimpleft form, and we thallex plain in very gencral te: ms their mode of operation. We flall then give a concife and popular theory of their oferation, furnihing principles to direct us in their c infteration; and we flall conclude with the defcription of a few peculiarities which may contribute to their improvement or perfétion.

There are but two forts of pumps which effientially difier; and all the varieties that we fee are only modifications of thete. One of thefe original pumps has a folid pifton; the other has a pifton with a perforation and a valve. We ufuaily call the firft a forcing pump, and the fecond alifting or sucking pump.

Fig. 2. is a fketch of the forcing pump in its moft rorcing ${ }^{3}$ fimple form and fituation. It conlifts of a hollow cy-pump delinder AC ca, called the working barrel, open at both feribed. ends, and having a valve $G$ at the bottom, opening upwards. This cylinder is filled by a folid pitton EF, covered externally with leather or tow, by which means it fits the bor of the cylinder cratty, and allows no water to elcape by its fides. There is a pipe KHD, which communicates laterally with this cylinder, and has a valve at fome convenient place H , as ncar as pofible to its junction with the cylinder. This valve alfo opens upwa:ds. This pipe, ufually called the rising pipe, or main, terminates at the place $D$, where the watermult be delivered.

Now fuppofe this apparatus fet into the water, fo Its niode of that the upper end of the cylinder may be under or operaticul. even with the furface of the water AD; the water will open the valve G , and after filling the barrel and lateral pipe, will alfo open the valve H , and at lant fand at an equal height within and withont. Now let the pifton be put in at the top of the working batrel, and thruft down to K. It will pufh the water before it. This will thut the valve G , and the water will make its way through the valve H , and fill a part ib of the rifing pipe, equal to the internal capacity of the working barrel. When this downward motion of the pifton ceafes, the valve $H$ will fall down by its own weight and fhut chis palfage. Now let the pifon be drawn up again: The valve $H$ hinders the water in
 exprels any thing lite what we call a pump. In all thefe paffages the words eitlice exprefs generally the drawing of water, or, more particularly, the drawing it with a bucket or fomething fimilar. 'Arraoe, which is the primitive, is a drain, fink, or receptacle for colleeting feattered water, either for ufe, or tn get rid of it ; hence it came to fignify the fink or well of a thip; and 'avt $\boldsymbol{\text { cer }}$ was fynonymous with our verb "t to bale the boat." (Didyf: O. 476 . M. 411. Euryp. Hecuba, 1025 ). 'Aven, 6 is the veffel or bucket with which water is drawn.
 the force of Ariftote's exprefion (Oecon. 1). тco $\gamma \alpha \rho$ ' $n 9 \mu \tilde{\omega}$ av $\lambda \lambda \epsilon t$ tout' ist. See even the late authority of the New 'Teflament, John ii. 8.; iv. 7. 11. Here 'arrin $\mu \mathrm{x}$ is evidently fomething which the woman brought alcng with her ; probably a bucket and rope.
the rifing pipe from returning into the working barrel. But now the valve $G$ is opened by the preffure of the external water, and the water enters and fills the cylinder as the pifton rifes. When the pifton has got to the tnp , let it be thruft down again: The valve G will again be flut, and the water will be forced through the pallage at H , and rife along the main, pufhing before it the water already there, and will now have its furface at L. Repeating this operation, the water mult at laft arrive at D , however, remote, and the next ftroke would raife it to e ; fo that during the next rife of the pifton the water in $e \mathrm{D}$ will be running off by the spont.

The effect will be the fame whatever is the pofition of the working barrel, provided only that it be under water. It may lie horizontally or floping, or it may be with its mouth and pifton rod undermoft. It is fill the fame forcing pump, and operates in the fame manner, and by the fame means, viz. the preffure of the furrounding water.
The external force which mut be applied to produce this effer is oppofed by the preffure exerted by the water on the oppofite face of the pifton. It is evident, from the conmon laws of hydroltatics, that this oppofing preflure is equal to the weirht of a pillar of water, having the face of the pifton for its bale, and the perpendicular height $d \mathrm{~A}$ of the place of delivery above the furface of the water $A B$ in the ciftern for its height. The form and dimenfions of the rifing pipe are indifferent in this refpect, becaufe heavy fluids prefs only in the proportion of their perpendicular height. Obferve that it is not $d \mathrm{~F}$, but $d \mathrm{~A}$, which meafures this preffure, which the moving force mult balance and furmount. The whole preflure on the under furface $\mathrm{F} f$ of the pifton is indeed equal to the weight of the pillar d $\mathrm{F} f \delta$; but part of this is balanced by the water AF $f a$. If indeed the water does not get into the upper part of the working barrel, this compenfation does not obtain. While we draw up the piton, this preffure is removed, becaufe all communication is cut off by the valve H , which now bears the whole preffure of the water in the main. Nay, the afcent of the pifton is even aflifted by the preflure of the furrounding water. It is only during the defcent of the pifton therefore that the external force is neceffary.

Obferve that the meafure now given of the external force is only what is neceffary for bulancing the preffure of the water in the rifing pipe. But in order that the pump may perform work, it mall furmonnt this preffure, and caule the wa:er to iffue at D with fuch a velocity that the required quantity of water may be delivered in a given time. This requires force, cven although there were no oppofing preflure; which would be the cafe if the main were horizontal. The water fills it, but it is at relt. In order that a gallon, for inftance, may be delivered in a fecond, the whole water in the horizontal main muft be put in motion with a certain velocity. This requircs force. We muft therefore always difinguifh between the fate of equilibrium and the ftate of actual working. It is the equilibrium only that we confider at prefent: and no more is neceflary for undertanding the operation of the different fpecies of pumps. The other force is of much more intricate inveltigation, and will be confidered by itrelf.

The fimplef form and fituation of the lifting fump is reprefented by the fketch fig. 3. The pump is immerfed in the ciftern till both the valve $G$ and pitton Lifting ${ }^{5}$ F are under the furface AB of the furrounding water, pump. By this means the water enters the pump, opening both valves, and finally ftands on a level within and without.

Now draw up the pifton to the furface $A$. It mult Its noodc lift up the water which is above it (becaufe the valve operatir in the pifon remains fhut by its own weight) ; fo that its furface will now be at $a, \mathrm{~A} a$ being made equal to AF. In the mean time the preflure of the furrounding water forces it into the working barrel, through the valve $G$; and the barrel is now filled with water. Now, let the piton be puihed down again ; the valve G immediately fhuts by its own weight, and in oppofition to the endeavours which the water in the barrel makes to efcape this way. This attempt to comprefs the water in the barrel caufes it to open the valve $F$ in the pifton ; or rather, this valve yields to our endeavour to pufh the pilton down through the water in the working barrel. By this means we get the pifton to the bottom of the barrel; and it has now above it the whole pillar of water reaching to the height $a$. Drawing up the pifton to the furface A a fecond time, mult lift this donble column along with it, and its furface now will be at $b$. The pilton may again be thrull down through the water in the barrel, and again drawa up to the furface which will raife the water to $c$. Ancther repetition will raife it to $d$; and it will now fhow itfelf at the intended place of delivery. Another repetition will raife it to $e$; and while the piton is now defcending to make another froke, the water in $c d$ will be running off through the fpout D ; and thus a fream will be produced, in fome degree continual, but very unequal. 'This is inconvenient in many cafes : thus, in a pump for domeftic ufes, fuch a hobbling fream would make it very troublefome to fill a bucket. It is therefore ufual to terminate the main by a ciftern LMNO, and to make the fpout fmall. By this means the water brought up by the fucceflive frokes of the pifton rifes to fuch a height in this ciftem, as to produce an efllux by the foout nearly equable. The fmaller we make the fpout D the more equable will be the fream; for when the pifton brings up more water than can be difcharged during its defeent, fome of it remains in the ciftern. This, added to the fupply of next Atroke, makes the water rife higher in the ciftern than it did by the preceding froke. This will caufe the efllux to be quicker during its dcfeent of the pifton, but perhaps not yet fufficiently quick to difcharge the whole fupply. It therefore rifes higher next ftroke; and at laft it rifes fo high that the increafed velocity of eflux makes the difcharge precifely balance the fupply. Now, the quantity fupplied in each ftroke is the fame, and occupies the fame room in the ciftern at top; and the furface will fink the fame number of inches during the defcent of the pifton, whether that furface has been high or low at the beginning. But becaufe the velocities of the efllux are as the fquare roots of the heights of the water abcve the fpout, it is evident that a fink of two or three inches will make a finaller change in the velocity of efflux when this height and velocity are great. This feems but a triflirg obfervation; but it ferves to illultrate a thing to be confidered afterwards, which is important and abftufe, but porfectly fimilar to this.

## P U M

$1 t$ is cyident, that the force neceniary for this nperation muft be equal to the weight of the pillar of water dia $a$, if the pipe be perpendiculat. If the pump be fanding afope, the peefiure which is to be belanced is fill equal to the weight of a pillar of water of this perpendicalar lesight, and hav ing the futace of the pifon io: its bare.

Such is the fimplef, and, we may add, by far the heft, form of the forcing and lifting pumps; but it is not the moft nfual. Ci:cumfances of conrenience, economay, and more ferquently of fancy and habit, have caufed tlic purinpmakes to deviate greatly from this form. It is net nitual to have the working barrel in the water ; this, cfpecial!' i: deep we!ls, makes it of difficult accefs for repairs, and requires long pilton mds. This would not do in a forci::g pump, becaufe they would bend.

We have fuppofed, in our account of the lifting pump, that the rife of the pitton always terminated at the furface of the water in the cillem. This we did in order that the barrel might always be filled by the preffure of the furrounding water. But let us frippofe that the rife of the pifton does not end here, and that it is gradually drawn up to the very top: it is plain that the preflure of the atmofphere is by this means taken off from the water in the pipe (fee Pneumarics), while it remains prelling on the water of the ciftern. It will thercfore caufe the water to follow the pifton as it rifes through the pipe, and it will raife it in this way 33 feet at a medium. If, therefore, the fpout D is not more than 33 feet above the furface of the water in the cifern, the pipe will be full of water when the pifon is at D. Let it be puhned down to the bntton; the water will remain in the pipe, becaufe the valve $G$ will thut: and thus we may give the pifton a froke of any length not exceeding 33 feet. If we raife it higher than this, the water will net follow; but it will remain in the pipe, to be lifted by the pifton, after it has been pufhed down through it to the bottem.

But it is not neceflary, and would he very inconvenient, to give the pifton fo long a flroke. The great ufe of a pump is to render effecual the reciprocation of a fhort froke which we can command, while fuch a long froke is generally out of our power. Suppofe that the pifton is pufhed down only to $b$; it will then have a column $b f$ incumbent on it, and it will lift this column when again drawn up. And this nperation may be repeated like the former, when the pitton was always under water; lor the preflure of the atmolif here will always caufe the water to follow the pifton to the height of 33 feet.

Nor is it neceflary that the fixed valve $G$ be placed at the lower orifice of the pipe, nor even under water. For, while things ate in tha flate now defrebed, the pifton drawn up to $f$, and the whale pipe full of water; if we fuppofe another valve placed at $\delta$ above the furface of the citern, this valve can do no harm. Now let the pifton defeend, both ralves $G$ and $b$ will fhut. G may now be removed, and the water will remain fupported in the face $b \mathrm{G}$ by the air; and now the alternate motions of the pilton will produce the farne effect as bcfore.

We found in the former cafe that the pilan was carrying a load equal to the weight of a pillar of water of the height AD, becaufe the furrounding water could only fupport it at its own level. Let us fee what change is produced by the affitance of the prefure of the at-
min focre. Let bis: under furfitec of the pip?on be at $b$; Whan the pithon was at $f, 33$ feet thove the furlace of the ciftern, the water was maifed on that licight by the pretliure of the armotpherc. Suppofe a paation mate at $b$ by a thin flate, and :ll the water alb, it taken away. Now pierce a hole in this ploce. The proliure of the atmo fricre was able to carry the whole column $f a_{0}$ Pant of this echum is now removed, an! the :emainder is not a balanec for the an'spreffise. This will therefore calue the watcr of fonut up :hrough this linie and rife to $f$. Therefore the under furface of this plate is prefo fod up by the contignnus waier with a force equal to the weight of that pillar of wa*er which it formery fupported; that is, with a force equal to the weight of the pillar / 6 . Now, the under furface of the pifton, when at $b$, is in the fame fituation. It is preffed upirardis by the water below $i$, with a force equal to the weight: of the column $f b$ : But it is preffed downowards by the whole preffure of the atmofiphere, which preffes on :ill bodies; that is, with the weight of the piliar $f a$. Oa the whole, therefore, it is prefied downwards by a force equal to the difference of the weights of the pillars $f a$ and $f l$; that is, by a force equal to the weight of the pillar $b a$.

It may be conccived better perhaps in this way. When the pifon was under the furface of the water in the ciftern, it was equally prelfed on both fides, boils by the water and atmofiphere. The atmofphere exertedits preffure on it by the intervention of the water; which being, to all fenfe, a perfeet fluid, propagates every external prefure undiminithed. When the pifon is drawn up above the furface of the pit-water, the atmofphere
continues to prefs on its upper furface with its whole up above the furface of the pit-water, the aimofphere
continues to prefs on its upper funface with its whole weight, through the intervention of the water which
lies above it; and its preffure muft therefure be added weight, through the intervention of the water which
lies above it; and its preffure muft thercfure he added to that of the incumbent water. It alío continues to prefs on the under furface of the pifton by the interven-
tion of the water: that is, it prelles this water to the tion of the water; that is, it prelles this water to the pifton. But, in doing this, it carrics the weight of this water which it is preffing on the piton. The preffurc on the pifton therefore is only the excefs of the whole preflure of the atmofiphere above the weight of the column of water which it is fupporting. Therefore the difference of atmofpheric preffure on the urper and under furfaces of the piton is preciscly equal to the and under marfaces of the piton is preciscly equal to the the air. It is not, however, the individual weight of the air. It is not, howeyer, the individual weight of
this column that loads the pifon ; it is the part of the preflure of the atmofphere on its upper furface, which is not balanced by its preffure on the under furface. In attempting therefore to draw up the pi.ton, we have to furmount this unbalanced part of the prefiure of the
atmofphere, and alfo the weight of the water which to furmount this unbalanced part of the preffure of the
atmonfphere, and alfo the weight of the water which lies above the piften, and muft be lifted by it: and thus the whole oppofing preffure is the fame as before, name-
ly, the weight of the whole vertical pillar teaching from the whole oppofing preflure is the fame as before, name-
ly, the weight of the whole vertical pillar teaching from the furface of the water in the cinern to the place of delivery. Part of this weight is immediately carried by
the prefure of the atmofphere; but, in lieu of it, there delivery. Part of this weight is immediately carried by
the prefure of the atmofphere; but, in lieu of it, there is an equal part of this prellure of the atmofphere ab-
llracted from the under furface of the pifton, while it; flracted from the under furface of the pifton, while it; upper furface fuflains its whole prediure.
So far, then, thefe two fates of the pump agree. But they differ exceedingly in their mode of cperation ; and there are fome circumfances not very obvious which muft be attended to, in order that the pump may deli-

Tump.

## I' U M

t'ump. a ferious examination.

Let the fixed valve $G$ (fig. 4.) be fuppofed at the firface of the ciltern water. Let $M m$ be the loweft, and $\mathrm{N}_{l}$ the higheft, pofitions of the pilton, and let $H_{A} A=b$ be the height of a column of water equiponderant with the atmofphere.

When the pump is filled, not with water, but with air, and the pifton is in its loweft politon, and all in equilibrio, the internal air has the fame denfity and elafticity with the external. The fpace MA a m, there. fore, contains air of the common denfity and elaflicity. Thefe may be meafured by $h$, or the weight of a column of water whofe height is $l$. Now, let the pifton be drawn up to N \%. 'The air which nccupied the pace MA a mow occupies the foace AA $a n$, and its dunity is now $\frac{\mathrm{MA} \text { arm }}{\mathrm{NA} \text { a } 14}$. Its elafticity is now diminithed, being proportionable to its denfity (fee Pneumatics), and nos longer balances the prellure of the atmofpere. The valve $\dot{G}$ will therefore be forced up by the water, which will tife to fome height SA. Now let the pitton again defcend to $\mathrm{MI} m$. It cannot do this with its valve fhut ; for when it comes down fo fir as to reduce the air again to its common denfity, it is not yet at M, becatufe the face below it has been diminifhed by the water which got into the pipe, and is retained there by the valve $G$. The pifton valve, therefore, openshy the air which we thus attempt to compreis, and the fuperfluous air ceapes. When the pifton has rot to $M$, the air is again of the common denfity, and occupies the face MS s ni. Now draw the pifton up to N. 'This air will expand into the fpace NS $s n$, and its denfity will be reduced to $\frac{\mathrm{MS} s m}{\overline{\mathrm{NS}} \text { sn}}$, and its elalticity will no longer balance the preffure of the atmofphere, and more water will enter, and it will rife higher. This will go on continually. But it may happen that the water will never rife fo high as to reach the pifton, even though not 33 fect above the water in the ciftern: For the fuccellive diminutions of denfity and elafticity are a feries of quantities that decreare.geometrically, and therefore will have a limit. Let us fee what determines this limit.

At whatever height the water flands in the lower part of the pipe, the weight of the column of water SA as, together with the remaining elafticity of the air above it, exactly balånces the preflure of the atmofphere (jec Pneumatics, no 108.) Now the elaficity of the air in the fate NS s $n$ is equal to $b \times \frac{\mathrm{MS} s m}{\mathrm{NS} s} n$. Therefore, in the cafc where the limit obtains, and the water rifes no farther, we mult have $b=\mathrm{AS}+\frac{\mathrm{MS} \sin }{\mathrm{NS} s}$, or, becaure the column is of the fame diameter thoughout, $b=$ $A S+b \frac{M S}{N S}$ and $\frac{\mathrm{MS}}{\mathrm{NS}}=\beta-\mathrm{AS},=\mathrm{HS}$, and NS : MS -HA:HS, and NS-MS: NS=HA-HS:HA, or $N M: N S=A S: A H$, and $N M \times A H=N S \times A S$ Therefore, if $A N$, the diftance of the pifton in its bifyelt pofition from the water in the ciftern, and NM the length of its ftroke, be given there is a certain deternined height As to which the water can be railed by the prefure of the air: For AII is a conltant quan-
tity; and therefore when MN is given, the rechangle AS' $\times S N$ is given. If this height AS be lefs than that of the pifton in its lowelt poftion, the pump will raife no water, although $A N$ may be lefs than AH. Yct the fame pump will raife water very effectually, if it be firlt of all filled with water; and we lave feen profeffional engineers much puezled by this capricious failure of their pumps. A little knowledge of the principles would have prevented their difappointment.

To infure the delivery of water by the pump, the Mod froke muft be fuch that the rectangle $\mathrm{MN} \times \mathrm{AH}$ may infur be greater than any rectangle that can be made of the the parts of $A N$, that is, greater than the fquare of half very AN. O:, if the length of the ftroke be already fixed wate by other circumitances, which is a common cafe, we mult make $A N$ fo fhort that the fquare of its half, meafured in feet, fhall be lefs than 33 times the froke of the pifton.

Suppofe that the fixed valve, infead of being at the furface of the water in the ciftern, is at $S$, or any where between $S$ and $A$, the performance of the pump will be the fame as before: But if it be placed anywhere above $S$, it will be very different. Let it be at T. It is plain that when the piton is pufhed down from N to M, the valve at ' T prevents any air from getting down ; and therefore, when the pifon is drawn up again, the air containcd in the fpace MT $t$ in will expand into tho fpace N' $t n$, and its denfity will be $\frac{\mathrm{MT}^{\prime}}{\mathrm{N}^{\prime}}$. This is lcfs than $\frac{\mathrm{MS}}{\mathrm{NS}}$, which expreffes the denfity of the air whicle was left in the fpace TS st by the former operations.The air, therefore in TS st will alfo expand, will open the vale, and now the water will rife above S. The proportion of NS to N'T may evidently be fuch that the water will even get above the valve $T$. This diminifhes the face $N \Gamma t_{n}$; and therefure, when the pifton has been puthed down to M , and again drawn up to N , the air will be ftill more rarefied, and the water will rife fill higher. The foregoing reafoning, however, is fufficient to thow that there may ftill be a height which the water will not pafs, and that this height depends on the proportion between the flroke of the pifon and its diftance from the water in the ciftern. We need not give the determination, becaufe it will come in afterwards in combination with other circumftances. It is enough that the reader fees the phyfical caufes of this limitation: And, laftly, we fee plainly that the utmof lecurity will be given for the performance of the pump, when the fixed valve is fo placed that the pifton, when in its loweit pofition, fhall come into contact with it. In this cafe, Val the rarefaction of the air will be the completeft poffible ; eafil and, if there were no fpace left between the pifon and air valve, and all were perfetly air-tight, the rarefaction would be complete, and the valve might be any thing lefsthan 33 feet from the furface of the water in the ciftern.

Dut this perfect contait and tightnefs is unattainable; and though the pump may be full of water, its continual downward preffure caufes it to filuate flowly through every crevice, and the air enters through every pore, and even difengages itfelf from the water, with which a confiderable portion had been chemically com. bined. The pump by this means lofes water, and it requires fevcral ftrokes of bilk working to fill it aguin:

## PUM [ $6 ; 1$ ] PUM

and if he leathers have become dry, fo much admillimn
may be given to the air, that the pump will not fill itfelt with water loy ary aorking. It is then neceflary to pour water into it, which thuts up thefe palliges, and foon fets all to rights again. For thefe reafons, it is always prudent to place the fixed valve as low as other circumflanees will permit, and to make the pinon rid of tueh a length, that when it is at the bottom of its Arolee it thall be almon in comast with the value. When we are not limited by cther circumfances, it is evident that the be $\Omega$ pr fible form is to have both the pifton and the fixed valve under thic furface of the water of the ciftern. In this fituation they are always wet and air-tight. The chicf objection is, that by this difpofition they are net cafily come at when needing reprim. This is a material objestion in decp mines. In fuch fituations, therefore, we mult make the belt compenfation of differentcircumitances that we cam. It is ufual to place the fixed valve at a moderate diftance from the furface of the water, and to have a hole in the fide of the pipe, by which it may be got out. This is earefnlly flut up by a plate fimly fereved on, with leatlor or cement between the parts. This is ealled the clack door. It would, in every cafe, be very proper to have a fixed valve in the lower end of the pipe. Tlas would combine all advantages. Being alway's tight, the pipe would retain the water, and it would leave to the valre above it its full effert of inercaling the rarefaction. A fimilar hole is made in the working barrel, a little above the higheft polition of the pifton. When this needs repair, it can be grot at throught this hole, without the immenfe tronble of drawing up the whole rods.

Thus we have conducted the reader ftep by ftep, from the fimplect form of the pump to that which long experience has at laft felefed as the moft generally convenient. This we flath now deferibe in fome detail.

The Sucking Pump confift of two pipes DCCD, BAAB ( 6.5 .5 .) ; of which the former is called the Barrcl, wr the Working Barrel, and the other is called the Suffion-pite, and is commonly of a fmaller diameter.Theefe are joined by means of fanches E, F, pierced with holes to receive ferewed bolts. A ring of leather, or of lead, covered with a proper cement, is put between them; which, being Atrongly compreffed by the ferew-bolts, renders the joint perfeally air-tight. The lower end A of the fuetion-pipe is commonly lipread out a little to facilitate the entry of the water, and frequently las a grating acrofs it at AA to keep out filth or gravel. This is immerged in the flanding water YZ . The working barrel is cylindric:ll, as evenly and fmooth$1 y$ bored as poffible, that the pifton may fill it exactly through its whole length, and move along it with as litte fricion as may be confifent with air-tightnefs.

The pilloa is a fort of truneated cone OPKL, generally made of wond not apt to fplit, fuch as elm or beech. The fmall end of it is cut off at the fides, fo as to form a fort of arch OQP, by which it is faftened to the iron rod or fpear. It is exhibited in different pofitions in figures 6,7 . which will give a more difin ar notion of it than any defcription. The two ends of the conical part may be honped with brafs. This core has its larger end furrounded with a ring or band of frong leather faftened with nails, or by a copper horip, which is driven on it at the fmaller end. This bard flould reach to fome diftance beyond the base of
the enne ; the farther the better: and the whr, men be of uniform thicknefs all round, fo as to filfer cyual comfeffion between the cone and the wortang bantel. The fe:m or joint of the two ends of this and mout he made very chufe, but not fewed or Ritelie:! tr getion. This would necafion !nmps or incopu litic!, which woul I fpoil its tightnefs; and non larn cannefuit irem the sani of it, becaufe the two edges will be fquecyal daic :gether by the compretion in the barrel. If is b:~... means necellary that this comprefion b: gro 1 . If? is a very detrimentid error of the fump-matars. In necafons enormons friction, and deftoss the very p:rpofe which they have in view, vi\%. readering the filion air-tight ; for it canfes the leather to wear throngh very foon at the edge of the cone, and it alfo wears the working barrel. This very focn beconmes wide in that part which is continually palled over by the pillon, while the mouth remains of its original diameter, and it hecomes impoffible to thruft in i pitton which thall ecmpletely fill the worn part. Now, a very moderate fref. fire is fufficient for rendening the pump ferfealy tight, and a piece of ylove leather would be fufficient for thi:s purpole, if loofe or detacled from the folid cone; for fuppofe fuch a loofe and flexible, but impenvinus, band of leather put round the piton, and put into the barrel; and let it ever be fuppofed that the cone does t:ot comprefs it in the fmallef degree to its internal furface. Pour a little water carefully into the infide of this fort of cup or difh ; it will caufe it to fwell out a litile, and arply itfelf clofe to the barrel all round, and even adjuft itfelf to all its inequalities. Let us fuppofe it to touch the barrel in a ring of an inch broad all round. We can eafily complete the force with which it is preffed. It is half the weight of a ring of water an incls decp and an inch broad. This is a trifle, and the friction occafioned by it not worth regarding; yet this trifling preflure is fufficient to make the paflage perfectly imperviuus, even by the moft enormons prefliure of a high column of incumbent water; for let this preffure be ever fo great, the preflure by which the leather adheres to the barrel always exceeds it, becaufe the incumbent fuid has no preponderating power by which it can force its way between them, and it mult infinuate itfelf precifely fo far, that its preffure on the infide of the leather fhall fill exceed, and only exceed, the pref. fure by which it endeavours to infinuate itfelf; and thus the pifton becomes perfectly tight with the fmallent porfible friction. This reafining is rerhaps too refined for the uninftructed artift, and probably will not perfuade him. To fuch we could recommend an examination of the pittons anal valves contrived and exceuted by that artif, whofe fill far furpalles our higheft conceptions, the all-wife Creator of this world. The valves which fhut up in the parfages of the veins, and this in places where an extravafation would be followed by intant death, are cups of than membrane, which adhere to the fides of the charinel about half way round, and are detached in the relt of their circumference. When the blood comes in the oppofite direction, it pufles the membrane alide, and las a paffage petiectly free. Dut a flagnation of motion allow's the tone of the mufcular (perhaps) membrane, to reftore it to its natural fhape, and the lealt mation in the oppofite direction caufes it intiantly to clap clofe to the fides of the vein, and then ma preflure whatever can force 2 palfage. We dall recur

## Further de.

 chption of the luck-ifog-pump.to this again, when defcribing the various contrivances
of valves, \&cc. What we have fatid is enough for fu? of valves, \&c. What we have faid is enough for fuy-
porting our directions for conftuating a tight pitton. But ve recommended thick atad ftrong leather, white our prefent reafoning feems to render thin leather pre. ferable. If the leather be thin, and the folid pitton in any part does not preis it gently to the birrel, there will be in this part in unbalanced preflure of the incumtent column of water, which would inftantly burft even a Atroug leather bag; but when the folid pilton, covered with leather, exactly fills the barrel, and is even pref. fed a little to $i t$, there is no fuch rifk; and now that part of the leather band velhich reaches beyond the folid pifton performs its office in the comp.etelt manner. We do not hetitate, therefore, to recommend this form of a pilinn, which is the molt common and fimple of all, as yrefcrable, when well executed, to any of thofe more artificial, and frequently very ingenious, confruations, which we have met with in the works of the firf engineers. To proceed, then, with our defription of the fucking-pump.

At the joining of the working barrel with the fucing upwards. This hole $H$ is either made in a plate which makes a part of the fuction-pipe, being caft along with it, or it is made in a feparate plate. This laft is the moft convenient, being eatily removed and replaced. Different views are given of this valve in fig. $8,9,10$. The diameter EF (fig. 10.) of this plate is the fame with that of the flanches, and it has holes correfpond. ing to them, through which their bolts pafs whicl: keep all together. A ring of thick leather NKL is applied to this plate, having a part cut out between N and L , to make room for another piece of ftrong leather NR (fig. 9.) which compofes the valve. The circular part of this valve is broader than the hole in the middle of fig. 1c. but not quite fo broad as to fill up the infide of the ring of leather OQP of this fig. which is the fame with GKI of fig. 10. The middle of this leather valve is llrengthened by two brafs (not iron) plates, the uppermoll of which is feen at $R$ of fig. 9: the one on its underfide is a little fmaller than the hole in the valve-plate, that it may go freely in ; and the upper plate $R$ is layger than this hole, that it may comprefs the leather to its brim all round. It is evident, that when this plate with its leathers is put between the joint flanches, and all is fcrewed together, the tail of leather N of fig. 9. will be compreffed between the plates, and form a hinge, on which the valve can turn, rifing and falling. There is a fimilar valve fattened to the upper fide, or broadelt bafe of the pifton. This deIcription ferves for both valves, and in general for moft valves which are to be found in any parts of a pump.

The reader will now underftand, without any repetition, the procefs of the whole operation of a fuckingpump. The pifton rarefies the air in the working barrel, and that in the fuction-pipe expands thro' the valve into the barrel; and, being no longer a balance for the atmofpheric preflure, the water rifes into the fuctionpipe; another ftroke of the pifton produces a fimilar effect, and the water riles farther, but by a fmalier flep than by the preceding ftroke: by repeating the Atrokes of the pilton, the water gets into the barrel; and shen the pifon is now pufhed down through it, it gets
above the pilon, and muft now be lifted up to any height. The fution-pipe is commonly of fmaller fize than the working barrel, for the fake of economy. It is not necellary that it he fo wide: but it may be, and often is, made too fmall. It thould be of fuch a fize, that the prefure of the atmofphere may be able to fill the barrel with water as faft as the pifton rijes. If a void is left below the piaton, it is evident that the pifton muft be carrying the whole weight of the atmo. fphere, befides the water which is lying above it. Nay, if the pipe be only fo wide, that the barrel flall fill precifely as fat as the pifon rifes, it anuf fuftain all this preflure. The fostion-pipe fhould be wider than this, that all the prefliare of the atmofphere which exceeds the weight of the pillar in the luetion pipe mily be emploved in preffing it on the under furface of the pitton, and thus diminith the load. It cannot be made too wide; and too ftrift an conomy in this refpeet may very fenfibly diminith the performance of the pump, and more than defeat its own purpofe. This is moft likely when the fuetion-pipe is long, becaufe there the length of the pillar of water nearly balances the air's preilire, and leaves very little accelerating force; fo that water will rife but flowly even in the widen pipc. All thefe things will be made the fubjects of computation afterwards.

It is plain that there will be limitations to the rifo of the water in the fuction-pipe, fimilar to what we found when the whole pump was an uniform cylinder. Let $a$ be the height of the fixed valve above the water in the cifiern : let B and $b$ be the fipaces in cubic me:sfure between this valve and the pifon in its higheft and lowelt pofitions, and therefore exprefs the bulks of the air which may occupy thele faces: let $y$ be the diftance between the fixed valve and the water in the fuc-tion-pipe, when it has attained its greateft height by the rarefaction of the air above it: let $b$ be the lieight of a column of water in equilibrio, with the whole prefure of the atmofphere, and therefore having its weight in equilibrio with the elafticity of common air : and let $x$ be the height of the column whofe weight balances the elafticity of the air in the fuction-pipe, when rarefied as much as it can be by the action of the piften, the water ftanding at the height $a-y$.
Then, becaufe this elaft:city, together with the column $a-y$ in the fution pipe, mult balance the whole preffure of the atmofphere, (fee Pneumatics. $n^{\circ}$ 108.), we mult have $b=x+a-y$, and $y=a+$ - -3 .

When the pifon was in its loweft pofition, the bulk of the air between it and the fixed valve was 6 . Suppofe the valve kept fhut, and the pitton railed to its highen pofition, the bulk will be $B$, and its denfity $\frac{b}{B}$, and its elafticity, or the height of the columa whof weight will balance it, will be $b \frac{b}{B}$. If the air in the fustion pipe be denfer than this, and confenuently more elattic, it will lift the valve, and fome will come in therefore, when the pump has rarefied the air as much as it can, fo that none does, in fact, come in, the elafticity of the air in the fustion-pipe mand be the famc.
Therefore $x=b \frac{b}{\mathrm{~L}}$.

## l' U M

We had $y=a+x-b$. Therefore $y=a+b \frac{b}{b}$ $-b_{1}=a+\frac{b-B}{B} b_{2}=a-\frac{B-b}{B} h$.

Therefore when $\frac{\mathrm{B}-b}{13} b$ is lefs than $a$, the water will fop before it reaches the fixed valve. But when $a$ is lels than $\frac{B-b}{3} l$, the water will get above the fixed valve, $y$ becoming negative.

But it does not follow that the water will reach the pifon, that is, will rife fo high that the piton will pafs through it in its deícent. Illings now come into the condition of a pump of unicorm dimenfions from top ta bottom; and this point will be determined by what was faid when treating of finch a pump.

Thare is another form of the fucking pump which is much ufed in great water works, and is of equal eflicacy with the one now defcribed. It is indeed the fame pump in an inverted polition. It is reprefented in fig. Ir. where $A B C D$ is the working barrel, immerled, with its mouth downwards, in the water of the ciftern. It is joined by means of flatches to the rifing pipe or main.

This ufually confirts of two parts. The firt, BEFC, is bent to one fide, that it may give room for the iron fames TXYV, which carries the rod NO of the piton M, attached to the traveries RS, TOV of this frame. The other part, EGHF, is ufually of a lefs diameter, and is continued to the pare of delivery. The pifton frame XTVY liangs by the rod $Z$, at the arm of a lever or working beam, not brought into the figure. The pifon is perforated like the loumer, and is furrounded like it with a band of leather in form of a taper-dilh. It has a valve $\mathbb{K}$ on its broad or upper bafe, opening when pretfed from below. The upper end of the working barrel is pierced with a hole, covered with a valve I, alfo opening upwards.

Now fuppofe this apparatus immerfed into the ciftern till the water is above it, as marked by the line 2, 3, and the pilton drawn up till it touch the end of the barrel. When the pitton is allowed to delcend by its own weight, the water rifes up through its ralve $K$, and fills the burrel. If the pifton be now drawn up by the moving power of the macl i ery with which it is connected, the valve $\mathbb{K}$ fhuts, and the pifton puhthes the water before it through the valve I into the main pipe EFGH. When the pitton is again let down, the valve I fhuts by its own weight and the preflure of the water incumbent on it, and the barrel is again flled by the water of the ciftern. Drawing up the pilton puhes this water into the main pipe, \&c. and then the water is at length delivered at the place required.

This pump is ufually called the lifing pump; perhaps the fimpleft of all in its principle and operation.It needs no further explanation: and we proceed to defrribe

The Forcing Pump, reprefented in fig. 12. It confits of a working barrel ABCD , a fuction-pipe CDEF, and a main or rifng.pipe. This lat is ulually in three joints. The firt GHKI may be confidered as making part of the working barrel, and is commonly caft in one piece with it. The fecond IKLM is joined to it by flanches, and forms the cibow which this
pipe mult gencrally have. The third LNOM is pro.
perly the beginning of the main, and is continued to the place of delivery. At the joint IK there is a hanging valve or clack $S$; and there is a value $R$ on the top of the fuetion-pipe.

The pifton ICIV is folid, and is faftened to a flout iron rod which gues through it, and is fixed by a liey drawn through its end. The body of the pitton is a fort of double cone, widening from the middle to each end, and is covered with two bands of very Itrong lather, fitted to it in the manner already clefcribed.

The operation of this pump is ahundantly limple. Its noce When the pifton is thruf into the pump, it puthes the of opersair before it through the valve $S$, for the valve $k$ re- tiun mains fhut by its own weight. When it has reached near the botom, and is drawn up again, the air which filled the fmall fpace between the pitton and the valve S now expands into the barrel; for as foon as the air begins to expand, it ceares to balance the preflure of the atmofphere, which therefore thuts the valve $S$. By the expanfion of the air in the barrel the equilibrimn at the valve $R$ is deftroyed, and the air in the fucionpipe lifts the valve, and expands into the barrel ; coniequently it ceafes to be a balance for the preffure of the atmofphere, and the water is forced into the fuctionpipe. Puthing the pitton down again forces the air in the barrel through the valve $S$, the valve $R$ in the mean time fhutting. When the piton is again drawn up, S fhuts, R opens, the air in the fuction-pipe dilates anew, and the water lifes higher in it. Repeating thefe operations, the water gets at laft into the working barrel, and is forced into the main by puning down the pitton, and is pufhed along to the place of delivery.

The operation of this pump is therefore two-fold, fucking and forcing. In the firt operation, the fame force mult be employed as in the fucking-pump, namely, a force equal to the weight of a column of waier having the fection of the pifton for its bafe, and the height of the pifton above the water in the ciftern for its height. It is for the fake of this part of the operation that the upper cone is added to the pitton. The air and water would pais by the fides of the lower cone while the pifton is drawn up; but the leather of the upper cone applies to the farlace of the barrel, and prevents this. The face contained between the barrel and the valve $S$ is a sreat obftuction to this part of the operation, becaufe this air cannot be rarified to a very great degree. For this reafon the fuetion-pipe of a fercing-pump muft not be made long. It is not indeed neceffiry; for by placing the pump a few feet lower, the water will rife into it without difficulty, and the labour of fuction is as much diminifhed as that of impulfon is increafed. However, an intelligent artilt will always endeavour to make this fpace between the valve $S$ and the lowert place of the pifton as imall as polible.

The power employed in forcing muft evidently furmount the preffure of the whole water in the rifing pipe, and (independent of what is neceflary for giving the water the required velocity, fo that the proper quantity per hour may be delivered), the piltom has 10 withitand a force equal to the weight of a column of water having the fection of the pifton for its bafe, and the perpendicular altitude of the place of delivery above the lower füface of the gitton for its height. It is
quite indifferent in this refpeet what is the diameter of convenient part of the rifing pipe beyond the ralves there the rining pipe; becaufe the preflure on the pilton depends on the altitude of the water only, independent of its quantity. We floll even tee thit a finall iling pipe will require a greater force to convey the water along it to any given height or ditance.

When we would employ a pump to ratife water in a cooked pipe, or in any pipe of moderate dimenfions, this firm of pump, or fomething equivalent, muft be uled. In bringing up areat quantities of water from nines, the common fucking-pump is senerally employed, as really the beat of them all: but it is the moft exponfive, becaule it requires the pipe to be perpendicular, ftraight, and of ercat dimenfions, that it may coatain the piton rods. But this is imprasticable when the pipe is crooked.

If the forcing pump, conftucted in the manner now defcribed, be enmployed, we cannot ufe forces with long rods. Thefe would bend when pathed down by their further estremity. In this cate, it is ufual to employ only a fhert and hift rod, and to hang it by a chain, and load it with a weight fuperior th the weight of water to be rafed by it. The nachinery therefore is employed, not in forcing the water along the rifing-pipe, but in raifing the weight which is to produce this cffect by its fubfequent defient

In this cafe, it would be much better to employ the lifing-pump of hig. II. For as the load on the forcers numb be greater than the reffinces which it mull furmount, the force exerted by the machine muft in like mamer be greater than this load. This double excets would be avoided by ufing the lilting-pump.
Meafure of It will icalily occur to the reader that the quantity the quanti- of water delivered by any pump will be in the joint ty of water proportion of the furface or bate of the pifton
delivered by any rump. and its velocity: for this moafures the capacity of that part of the working barrel which the piton pathes over. The velocity of the water in the conduit pipe, and ia its pallage through every valve, will be greater or lefs than the velocity of the pitton in the fime proportion that the area of the pitton or work-ing-barrel is greater or lefs than the area of the conduit or valve. For whaterer quantity of water palfes through anyfection of the working-barrel in a fecond, the fame quantity mut go through any one of thefe pathages. 'This enables us to modify the velocity of the water as we pleate : we can increafe it to any de. gree at the place of delivery by diminibing the aperture through which it paffes, provided we apply furi-

## 26

The upera. tion of jumps not equable ;

It is evident that the oparation of a pump is by farts, and that the water in the main remains at rent, preflang on the valve during the time that the piiton is withdrawn from the bottom of the working barrel. It is in moft calcs defirable to lave this montion nquable, and in fome cafes it is abfolutely neceffiry. Thus, in the engine for extinguifhing fires, the fiphet of water going by jerks conld never be directed with a certain ailin, and half of the water would be lat by the way; becaulc a body at relt cannot in an inflant be put in raphid motion, and the firlt portion of every jerk of water would have but a imall velocity: A very ingenious contrivance la:as been fallen upon for obviating this inconvenience, and procuring a fream nearly cquable. We have not been able to dicover the auhor. At any
is annexed a capacious veffel VZ (fig. 13. $1^{\circ} 1$ and 2.) clofe atop, and of great frength. When the water is furced along this pipe, part of it gets into this vefiel, keeping the air contined above it, and it fills it to fuch a licight V , that the elafticity of the confned air balances a column reaching to T , we flall fuppofe, in the nimg pipe. The next ftroke of the pifton fends forward more water, which would fill the iling pipe to fome height above T. But the preffure of this aciditional column caufes fome more of it to go into the air veffel, and comjrefs its air fo much more that its elafticity now balances a longer column. Every fucceeding Proke of the pifton produccs a like effect. Tle wat ter rifes higher in the main pipe, but fome more of it goes into the air-veflel. At laft the water aptars it the place of delivery; and the air in the air-veffel is now fo much comprefled that its elafticity balances the preffure of the whole culumn. The next ftroke of the pifton fends forward fome more water. If the diameter of the orifice of the main be fufficient to let the water flow out with a velocity equal to that of the fitton, it will fo fow out, rifing no higher, and produ. cing ro fentible addition to the compreftion in the air-veffel. But if the orifice of the main be contracted to half its dimenfions, the water fent forw.rd by the pifton camot flow out in the time of the ftroke without a greater velocity, and therefore a greater force. Pa:t of it, therefore, goes into the air-velfel, and increafes the compreflion. When the pifton has ended its ftroke, and no more water comes formard, the compretlion of the ais in the air-velfel being erreat. er than what was futhicient to balance the preture of the water in the main pipe, now forces out fome of the water which is lying below it. This cannot return towards the pump, becaufe the valve $S$ is now fhut. It therefore goes for ward along the main, and produces an eflux during the time of the pifton's rifing in or der to make another ftroke. In order that this cfiluz may be very equable, the air-veffel mut be very large. If it be fmall, the quantity of water that is difcharged by it during the return of the pifton makes fo great a portion of its capacity, that the elafticity of the confined air is too much diminithed by this enlargement of its bulk, and the rate of elux mut diminilh accordingly. The capacity of the air-velfel fhould be fo great that the change of bulk of the comprofed air during the ination of the píton may be incontiderable. It mult therefore be very ftrong.

It is pretty indifterent in what way this air-veffel is comeded with the rifing pipe. It may join it laterally, as in fig. $13 \cdot n^{\circ} 1$. and the main pipe go on wi:hout interruplion; or it may be maje to furround an interruption of the main pipe, as in fig. $13 . n^{\circ} 2$. It may alio be in any part of the man-pipe. If the fole ef. feef intended by it is to produce an equable jet, as in ornamental water-works, it may be near the end of the main. This will require much let's Atength, becaufe there remains but at thort column of water to comprefs the air in it. lout it is, on the whole, more advantageous to place it as near the pump as pollible, that it may produce an equable motion in the whole main-pipe. This is of confiderable advantage: when a column of water feveral hundred feet long is at rett in the main pipe, and the piton at one ead of it put at once into motion?

## P U M <br> r U M

cven with a moderate velocity, the ftain on the pipe the pifton during its efferive ftroke. The continued would be very great. Indeed if it were pollible to put the pifton inftantaneounf into motion with a fimite velocity, the ftrain on the pipe, tending to burft it, would be next to infinite. But this feems impoffible in na-cful- ture; all changes of motion which ace obferve are gradual, becaufe all impelling bodies have fome elafticity or foftuefs by which they yicld to compreffion. And, in the way in which piftons are commonly moved, viz. by cranks, or fomething analngnus to them, the mo. tion is very ferfibly gradual. But ftill the air-veffel tends to make the motion along the main-pipe leís defultory, and therefore diminifhes thofe ftains which would really take place in the main-pipe. It acts like the fprings of a travelling carviage, whofe jolts are incomparably lefs than thofe of a cart; and liy this means really enables a given force to propel a greater quan. tity of water in the fame time.

We may here by the way obferce, that the attemps of mechanicians to correet this une qual motion of the pifton-rod are mifplaced, and if it could be done, would greatly hurt a pump. One of the bett methods of producing this effect is to make the pilton-rod confirt of two parallel bars, having teeth in the fides which front each other. Let a tonthed wheel be placed between them, having only the half of its circumference furnifhed with teeth. It is evident, without any farther defcription, that if this wheel be turned uniformly round its axis, the pifon-rod will be moved unilormly up and down without intermifion. This bas often been put in practice; but the machine always went by jolts, and foldom lafted a few dayz. Unfkilled incchanicians attributed this to defest in the execution: but the fault is effiential, and lies in the principle.

The machine could not perform one froke, if the firft mover did not flacken a litt?, or the different parts of the machine did not yield by bending or by compreffion; and no frength of materials could withfand the violence of the frains at every reciprocation of the motion. This is chiefly experienced in great works which are put in motion by a vater-wheel, or fome nther cqual power exerted on the mafs of matter of which the machine confits. The water-wheel being of great weight, moves with confiderable feadinefs or uniformity; and when an additional refiftance is oppofed to it by the beginning of a new Aroke of the piflon, its great quantity of motion is but little affected by this addition, and it proceeds very little retarded; and the machine mult either yield a little by bending and compreffion, or go to pieces, which is the comnion event. Cranks are free from this incenvenience, becaufe they accelcrate the pilon gradually, and bring it gradually to reft, while the water-wheel moves round with almot perfeat uniformity. The only inconvenience (and it may be confiderable) :ttending this flow motion of the pifton at the beginning of its litroke is, that the valves do not fhut with rapidity, fo that fome water gets back thrnugh them. But when they are p:operly formed and loaded, this is but trifing.

We mull not imagine, that becaufe the fleann produced by the affifance of an air-barrel is almoft perfcolly equable, and becaufe as much water runs cut during the returning of the pifton as during its active fruke, it therefore doubles the quantity of water. No bers. more water can run out than what is fert forward by
fre:um is produced only by preventing the whole of this water frem being difcharged during this time, and by providing a propecting force to at during the pifton's return. Nor does it en:ible the moving force of the piftom to produce a double eflect : tor the compreflion wheh is produced in the air. velfed, more than what is necelfary for merely batancing the quiefent colunm of water, realds on the pifton, refiling its compreflion jult as much as the column of water would do which produces a velocity equal to that of the eflins. Tk:n; if the water is made to fiput with the velocity of eighe feet per fecond, this would require an additional column of one foot high, and this would jult balance the compreflion in the air-veffel, which maintains this vel city during the ron-action of the piften. It is, however, a matter of fart, that a pump furnilhed with an air-veffel delivers a little more water than it wonld do without it. But the difference depends on the combination of many very diti:milar circumftances, which it is extremely difficult to bring into calculation. Some of thefe will be mentioned afterwards.

To defcribe, or even to cnumerate, the immenis variety of combinations of thefe three limple pumps would fill a volumc. We fhall felect a fe $x$, which are more deferving of notice.

1. The common fucking-pump may, by a fmall addition, be converted into a lifting-pump, fitted for propelling the water to any diftance, and with any velocity.

Fig. r.t. is a fucking-pump, whofe working-barrel ACDB has a lateral pipc AEGHF connetted with it clofe to the top. 'I'his terminates in a main or riting pipe IK, furnifhed or not with a valve L. The top of the barrel is thut up by a Arong plate MN, having a hollow neek teminating in a fmall flanch. The pitton rod QR paffes through this neck, and is nicely turned and polithed. A number of rings of leather are put over the rod, and ftrongly comprefied round it by another flanch and feveral fcrewed bolts, as is reprefented at OP. By this contrivance the rod is clofely grafoel by the leathers, but miy be eafily drawn up and down, while all palfage of air or water is effectually prevented.

The pifton $S$ is perforated, and furnifled with a valve opening upwards. There is alfo a valve $T$ on the top of the fuction-pipe YX; and it will be of advantage, though not abjolutely neccffary, to put a valve 1, at the bottom of the riting pipe. Now suppofe the piftom at the bottom of the working-barrel. When it is drawn up, it tends to comprefs the air ahove it, becaufe the valve in the pifon remains that by its own weight. The air therefore is driven through the valve 1 into the rifing pipe, and cicapes. In the mean time, the air which occupied the farall face between the piflon and the valve $T$ expands into the upper part of the working barrel; and its elacity is fo much diminilhed thereby, that the atmolfhere pieffes the water of the ciftem into the fuction-pipe, where it will rife till an equilibrium is again produced. The next downward firoke of the pifton allows the air, which had come from the fustion pipe into the barrel during the afeent of the pilton, to get through its value. Tpon drawing up the pifton, this air is alfo drawn off throngh the nifing pipe. Repeating this preceis brings the wa-
ter at laf into the working－barrel，and it is then driven along the riling－pipe by the pifton．

This is one of the belt forms of a pump．The ra－ refaction may be very perfect，becaule the pitton can be brought fo near to the bottom of the working－ barrel：and，fur forcing water in oppolition to grat prelfures，it appears preferable to the common forcing－ punp ；becaufe in that the pifon roda arc compreffed and expofed to bending，which greatly hurts the pump by wearing the pilton and barrel on one fide．This foon renders it lefs tight，and much water fquirts out hy lhe fides of the pifton．But in this pump the pitton rod is always drawn or pulled，which keeps it fraight ； and rods exert a much greater force in oppofition to a pull than in oppofition to comprefion．The collar of leather round the piton－rods is found by experience to need very little repairs，and is very impervious to water． ＇The whole is very accelible for repairs；and in this re－ fipet much preferable to the common pump in deep mines，where every fault of the pifton obliges us to draw up fome hundred feet of piton－rods．By this addition，too，any common pump for the fervice of a houfe is converted into an engine for extinguifhing firc， or may be made to convey the water to cvery part of the honfe：and this without hurting or obftructing its common ufes．All that is neceffary is to have a large cock on the upper part of the working－barrel nppo－ fite to the lateral pipe in this figure．This cock ferves fir a fpout whea the pump is ufed for common pur－ poles；and the merely thutting this cock converts the whole into an engine for extinguifhing fire or for fup－ plying diftant places with water．It is farcely necef－ fiary to add，that for thefe fervices it will be proper to connef an arrefiel with fome convenient purt of the rifing pipe，in order that the current of the water may be continual．

We have frequently fpoken of the advantages of a continued cunent in the main pipe．In all great works a confiderable dergree of uniformity is produced by the mamer of difpofing the actions of the different pumps； for it is very rarely that a machine works but one pump．In order to maintain fome uniformity in the eliftance，that it may not all be oppofed at once to the moving power，with intervals of total inaction，which would produce a very hobbling motion，it is ufual to dillribute the werk into portions，which fucceed alter－ nately；and thos both diminilh the frain，and give greater unifomity of attion，and frequently enabie a natural power which we can command，to perform a piece of work，which would be impoffible if the whole iefillance were oppofed at once．In all pump ma－ chines therefore we are obvioully directed to confruct them fo that they may give motion to at leaft two pumps，which work aitematcly．By this mans a mach greater uniformity of current is produced in the main pipe．It will be rendered till more uniform if four are employed，fucceeding each other at the interval of one quarter of the time of a complete firoke．

Bat ingenious men have attempted the fame thing with a lingle pump，and many different conftrutions for this purpofe have been propoled and executed． The thing is not of much importance，nor of great re－ fearch．We fhall content ourfelves therefore with the defcription of one that appears to us the molt perfect， both in refpect of fimplicity and effect．

I1．It confifts of a working－harrel AB（fg．15．） clofe at both ends．The pifton C is folid，and the rod OP pafles through a collar of leathers in the plate， which clofes the upper end of the working－barrel．This barrel conmanicates lateral！y with two pipes $\mathrm{H}, \mathrm{K}$ ；the communication $m$ and $n$ being as near to the top and bottom of the harrel as pullible．Adjoining to the pafage $m$ are two valses $F$ and $G$ opening upwards． Similar valves accompany the palfage \％．The two pipes $H$ and $k$ unite in a laser ning pipe $I$ ．They are all reprefented as in the fane plane ；but the upper ends muft be bant backwards，to give room for the mo－ tion of the pifton－rod OP．

Suppofe the pifon clofe to the entry of the lateral pipe $n$ ，and that it is drawn up：it comprettes the air above it，and drives it through the valve $G$ ，where it efcapes along the rifing pipe ；at the fance time it rarefies the air in the fpace below it．Therefore the weight of the atmofinere huts the valve E ，and caules the water of the ciltern to rife through the value $D$ ， and till the lower part of the pump．When the pitton is puhbed down again，this water is firf Criven through the valve $E$ ，becaufe $D$ immediately fhuts；and then mof of the air which was in this part of the pump at the beginning goes up through it，反one of the water coming back in it．flead．In the rnean time，the air which remained in the upper fart of the pump after the afcent of the pifton is rarefied by its defcent ；becauic the value $G$ muts as foon as the piton begins to de－ fcend，the valve $F$ opens，the air in this fuction pipe F $f$ expands into the barrel，and the water rifes ial to the pipes by the preflure of the atmofphere．The next rife of the pifon muft bring more water into the lower part of the barrel，and mut drive a little more air through the valve $G$ ，namely，part of that which had come out of the fuction－pipe Ff ；and the pext defcent of the pifton mult drive more water into the rifing pipe $H$ ，and along with it moft if not all of the air which remained below the pifton，and mult rarefy ftill more the air remaining above the pifon；and more water will come in through the pipe $\mathrm{F} f$ ，and get into the barrel．It is evident that a few repetitions will at lat fill the barrel on both fides of the pilton with water． When this is accomplifhed，there is no difficulty in per－ ceiving how，at every rife of the pifton，the water of the ciltern will come in by the valve D，and the water in the upper part of the birrel will be driven thro＇the valve $G$ ；and，in cvery defcentif the pifon，the water of the citern will come into the barrel by the valve $F$ ， and the water below the pifton will be driven thongh the valve $E$ ：and thus there will lie a continual infux into the barrel through the valves $D$ and $T$ ，an．l a con－ tinual difcharge along the rifing pipe $L$ through the valves E and C ．

This machine is，to be fure，equivalent to two forcing pumps，although it has but one barrel and one piton ；vale but it has no fort of fiperiority．It is not even more two economical in mont cales；becaufe we apprehend that cing． the additional workmanhip will fully compenfate for pum the barrel and pifton that is faved．There is indeed a faving in the reft of the machinery，hecaufe one lever produces both motions．We cannot thenefore firy that it is inferior to two pumps；and we acknowledge that there is fome ingenuity in the contrivance．

We recommend to our readers the pernfal of Beli－

## P U M

dor's Arebitecture Hydraulique, where is to be tound a greit varicty of combinations and forms of the fimple punips; but we muft caution them with refpect to his theorics, which in this article are extremely defective. Alfo in Leupold's Theatrum Machinarum Hydraulicarum, there is a prodigious variety of all kinds of pumps, many of them very fingular and ingenious, and many which have particular advantages, which may fuit local circumftances, and give them a preference. But it would be improper to fwell a work of this kind with fo many peculiarities; and a perfon who makes himfelf mater of the principles dclivered here in fufficient detail, can be at no lofs to fuit a pump to his particular views, or to judge of the merit of fuch as may be propofed to hirr.

We mult now take notice of fome very confiderable and important varieties in the form and contrivance of the cffential parts of a pump.
III. The forcing pump is fometimes of a very different form from that already defcribed. Inftead of a pillon, which applies itfelf to the inflde of the barrel, and fides up and down in it, there is a long cylinder POQ (fig. 16.) nicely turned and polifhed on the outfide, and of a diameter fomewhat lefs than the infide of the barrel. This cylinder (called a plunger) flides through a collar of leathers on the top of the worling barrel, and is conftructed as follows. The top of the barrel terminates in a flanch $a b$, pierced with four holes for receiving fcrew-bolts. There are two rings of metal, $s d$, ef of the fame diameter, and having holes correfponding to thofe in the flanch. Four rings of foft leather, of the fame fize, and fimilarly pierced with holes, are well foaked in a mixture of oil, tallow, and a little rofin. Two of thefe leather tings are laid on the pump flanch, and one of the metal rings above them. The plunger is then thruat down through them, by which it turns their inner edges downwards. The other two rings are then dlipped on at the top of the plunger, and the fecond metal ring is put over them, and then the whole are flid down to the metal ring. By this the inner edges of the laft leather rings are turned upwards. The three metal rings are now forced together by the fcrewed bolts; and thus the leathern rings are ftrongly compreffed between them, and made to grafp the plunger fo clofely that no preffure can force the water through between. The upper metal ring juft allows the plunger to pafs through it, but without any play; fo that the turned up edges, of the leathcin rings do not cone up between the plunger and the upper metal ring, but are lodged in a little corical taper, which is given to the inner edge of the upper plate, its hole being wider below than above. It is on this trifling circumilance that the great tightnefs of the collar depends. To prevent the leathers from fhrinking by drought, there is ufually a little ciftern formed round the head of the pump, and kept full of water. The plunger is either forced down by a rod from a working beam, or by a fet of metal-weights laid on it, as is reprefented in the figure.

It is hardly neceffary to be particular in explaining the operation of this pump. When the plunger is at the bottom of the barrel, touching the fised valve M with its lower extremity, it almoit completely fills it. That it may do it completely, there is fometimes a finall pipe RSZ branching out from the top of the barrel, Vos.. XV.
and fitted with a cock at $S$. Water is admitted th the barrel is completely fillect, and the cre's is then flut. Now when the planger is drawn up, the valve $N$ in the riling pipe nuft remain thut by the preflue of the atmofphere, an la void mut be made in the harrel. Therefore the valve $M$ on the top of the fuction-pipe mu:t be opened by the clanticity of the air in this pipe, and the air muft expand into the barrel; and, being no longer a balance for the atmofphere, the water in the ciftem mult be forced into the fustion-pipe, and rife in it to a certain leight. When the plunger defcends, it mut drive the water through the valve $N$ (for the valve $M$ will immediately fhut), and along with it molt of the air which had come into the barrcl. And as this air occupied the upper part of the barrel, part of it will remain when the plunger has reached the botton! ; but a ftroke or two will expel it all, and then every fucceeding Atroke of the defeending pifton will drive the water along the rifing pipe, and every afcent of the plunger will be followed by the water from the ciftern.

The advantage propofed by this for:n of pitton is, that it may be morc accurately made and polifhed than the infide of a working barrel, and it is of much eafier repair. Yet we do not find that it is much ured, a'though an invention of lat century (we think by Sir Samuel Morland), and much praifed by the writers on thefe fubje:ts.

It is eafy to fee that the fucking-pump may be vari- Suckinged in the fame way. Suppofe this plunger to be open puup fimiboth at top and bottom, but the bottom filled with a larly vivalve opening upward. When this is purhed to the rie.1. bottom of the barrel, the air which it tends to comprefs lifts the valve (the lateral pipe FIK being taken a way and the paffage thut up), and efcapes through the plunger. When it is drawn up, it makes the fame rarefaction as the folid plunger, becaufe the valve at $O$ fhuts, and the water will come up from the ciftern as in the former cafe. If the plunger be now thruft down again, the valve $M$ fhuts, the valve $O$ is forced open, and the plunger is filled with water. This will be litted by it during its next afcent; and when it is pulhed down again, the water which filled it mult now be pulhed out, and will flow over its fides into the ciltern at the head of the barrel. Infead of making the valve at the hottom of the pifton, it may be made at the tup; but this difpofition is much inferior, becaufe it cannot rarcfy the ait in the barrel one half. This is evident; for the capacity of the barrel and plunger together cannot be twice the capacity of the barrel.
IV. It may be made after a fill different form, as Another reprefented in fig. 17. Here the fuction-pipe CO form of the comes up through a ciftern KMNL deeper or longer fukingthan the intended flroke of the pifon, and has a valve pump. C at top. The pifton, or what acts in lieu of it, is a tube AHGB, open at both ends, and of a diameter fomewhat larger than that of the fuction-pipe. The interval between them is filled up at HG by a ring or belt of foft leather, which is faftened to the cutir tube, and moves up and down with it niding along the fmoothly polifined furface of the fuction-pipe with very little friction. There is a valve I on the top of this pifton, opening upwards. Water is poured into the outer ciftern.

42
The outer cylinder or pifton being drawn up frorn and its the bottom, there is a great arefustion of the air which wide of
wa, operation.
was between them. and the atmofphere preffes the water up through the fustion pipe to a certain height; for the valve I keeps fhut by the preffure of the atmofrhere and its own weight. Pufling down the pifton caufes the air, which had expanded from the fuctionpipe into the pifon, to efcape through the valve I; drawing it up a fecond time, allows the atmofphere to prefs more water into the fuction-pipe, to fill it, and al. fo part of the piflon. When this is pufhed down again, the water which had come through the valve C is now forced out through the valve I into the ciftern KMNL, and now the whole is full of water. When, the:efore, the pifton is drawn up, the water follows, and fills it, if $\because: 0 t .33$ fect above the water in the ciftern; and when it is pullied down again, the water which filled the pifton is all thrown out into the citern ; and after this it delivers its full contents of water every froke. The water in the cinern KNINL effegually prevents the entry of any air between the two pipes; fo that a very moderate comprefion of the belt of foft leather at the mouth of the pifton cylinder is fufficient to make all perfectly tight.

It might be made differently. The ring of leather might be faltened round the top of the inner cylinder at DE, and flide on the infide of the pifton cylinder ; but the firt form is mof eafily executed. Mufchenbroeck has given a figure of this pump in his large fy Item of natural philofophy, and fpeaks very highly of its performance. But we do not fee any advantage which it pofieffes over the commor fucking-pump. He inderd fays that it is without friction, and makes no mention of the ring of leather between the two cylinders. Such a pump will raife water extremely well to a fmall height, and it feems to have been a model only which he had examined: But if the fution-pipe is long, it will by no means do without the leather; for on drawing up the pifton, the water of the upper cifiern will rife between the pilton, and fill the pifon, and none will come up through the fuction-pipe.

We may take this opportunity of obferving, that the many ingenious contrivances of punps without friction are of little importance in great works; becaufe the friction which is completely fufficient to prevent all efcape of water in a well-conftrutted pump is but a very trifling part of the whole force. In the great pumps which are ufed in mines, and are worked by a Reamengine, it is very ufual to make the piftons and valves widhout any leather whatever. The working barrel is bored truly cylindrical, and the pifton is made of metal of a fize that will junt pafs along it without ficking. When this is drawn up with the velocity competent to a properly loaded machine, the quantity of water which efcapes round the pifton is infignificant. The pifon is made without leathers, not to avoid friction, which is alfo infignificant in fuch works; but to avoid the necefinty of frequently drawing it up for repairs through fuch a length co pipes.
V. If a pump abfolutely without friction is wanted, the following feems preferable for fimplicity and performance to any we have feen, when made ufe of in froper fituations. Let NO (fig. 18.) he the furface of the water in the pit, and $K$ the place of delivery. The pit mult be as deep in water as from K to NO. $A B C D$ is a wooden trunk, round or fquare, open at both ends, and having a valve $P$ at the bottom. The
top of this trunk muft be on a level with 15 , and has a fmall ciftern EADF. It alfo communicates laterally with a rifing pipe GHK, furnithed with a vaive at H opening upwards. LM is a beam of timber fu fitted to the trunk as to fill it without Iticking, and is of at leaft equal length. It hangs by a chain from a working beam, and is loaded on the top with weights cxceeding that of the column of water which it difplaces. Low fuppofe this beam allowed to defcend from the pofition in which it is drawn in the figure ; the water muft rife all around it, in the crevice which is between it and the trunk, and alfo in the rifing pipe ; becaufe the valve P fhuts, and H opens; fo that when the plunger has got to the bottom, the water will fland at the level of K. When the plunger is again drawn up to the top by the action of the moving power, the urater finks again in the trunk, but not in the rifing pipe, becaufe it is fopped by the valve H. Then allowing the plunger to defcend again, the water mult again rife in the trunk to the level of K , and it muft now flow out at K ; and the quantity difcharged will be equal to the part of the beam below the furface of the pitwater, deducting the quantity which fills the finall fpace betwecn the beam and the trunk. This quantity may be reduced almoft to nothing; for if the infide of the trunk and the outfide of the beam be made tapering, the beam may be let down till they exactly fit ; and as this may be done in fquare work, a good workman can make it exceedingly accurate. But in this cafe, the lower half of the beam and trunk mult not taper; and this part of the trunk mull be of fufficient width round the beam to allow free paffage into the rifing pipe. Or, which is better, the rifing pipe muft branch off from the bottom of the trunk. A difcharge may be made from the ciftern EADF, fo that as little water as poffible may defeend along the trunk when the piton is raifed.

One great excellcnce of this pump is, that it is per- fis feally free from all the deficiencies which in common lend pumps refult from want of being air-tight. Another con is, that the quantity of water raifed is precifely equal abla to the power expended; for any want of accuracy in the work, while it occafions a diminution of the quantity of water difcharged, makes an equal diminution in the weight which is neceflary for puhhing down the plunger. We have feen a machine confifting of two fuch pumps fufpended from the arms of a long beam, the upper fide of which was formed into a walk with a rail on each fide. A man ftood on one end till it got to the bottom, and then walked foberly up to the other end, the inclination being about twentyfive degrees at firft, but gradually diminifhed as he went along, and changed the load of the beam. By this means he made the other end go to the bottom, and fo on alternately, with the eaficit of all exertions, and what we are molt fitted for by our flructure. With this machine, a very feeble old nan, weighing 110 pounds, raifed 7 cubic feet of water $11^{\frac{1}{3}}$ feet high in a minute, and continued working 8 or 10 hours every day. A ftout young man, weighing nearly 135 pounds, raifed $8 \frac{t}{3}$ to the fame height; and when he carried 30 pounds ${ }_{m}$ conveniently flung about him, he raifed of feet to this height, working 10 hours a-day without fatiguing himfelf. This exceeds Defagulier's maximum of a loghead of water to feet high in a minute, in the pro-
portion

## F U M

portion of 9 to 7 nearly. It is limited to very moderate leights; but in fuch fituations it is very effectual. It was the contrivance of an untaught labouring man, poffefied of uncommon mechanical genius. We fluall have occafion to mention, with refpeet, fone other contrivances of the fame perfon in the article WarerWorks.

Vl. The moft ingenious contrivance of a pump without trition is that of Mr Hafkins, defrribed by Defaguliers, and called by him the Quicrsiluer Pump. Its conftruction and mode of operation are pretty complicated; but the following preliminary obfervations will, we hope, render it abundantly plain.

Letilmk (fig. 19.) be a cylindrical iron pipe, about fix feet long, cpen at top. Let eg bf be another cylinder, connected with it at the botton, and of imaller dianneter. It may either be folid, or, if hollow, it muft be clofe at top. Let $a c d b$ be a third iron cylinder, of an intermediate diameter, fo that it may move up and down between the other two without touching either, but with as little interval as poflible. Let this middle cylinder communicate by means of the pipe AB, with the upright pipe FE, having valves C and D (both opening upwards) adjoining to the pipe of communication. Suppofe the outer cylinder fufpended by chains from the end of a working beam, and let mercury be poured into the interval between the three cylinders till it fills the fpace to o $p$, about $\frac{3}{5}$ of their height. Alfo fuppofe that the lower end of the pipe FE is immerfed into a ciftern of water, and that the valve D is lefs than 33 feet above the furface of this water.

Now fuppofe a perforation made fomewhere in the pipe $A B$, and a communication made with an air-pump. When the air-pump is worked, the air contained in CE, in $A B$, and in the fpace between the inner and middle cylinders, is rarefied, and is abftrazted by the air-pump; for the valve D immediately thats. The preffure of the atmofphere will caufe the water to rife in the pipe CE, and will caufe the mercury to rife between the inner and middle cylinders, and fink between the outer and middle cylinders. Let us fuppofe mercury 12 times heavier than water: Then for every foot that the water rifcs in EC, the level between the outfide and infide mercury will vary an inch; and if we fuppofe DE to be 30 feet, then if we can rarely the air io as to raife the water to $D$, the catfide mercury will be depreffed to $q, r$, and the infide nercury will have rilen to $s, f, s q$ and $t r$ being about 30 incles. In this Itate of things, the water will run over by the pipe BA, and every thing will renain nearly in this pofition. The columns of water and mercury balance eacle other, and balance the preffure of the atmofphere.

While things are in this fate of equilibrium, if we a'low the cylinders to defcend a little, the water will -ife in the pipe FE, which we may now confider as a fustion-pipe; for by this motion the capacity of the whole is ertarged, and therefore the prellure of the atnofphere will till keep it full, and the fituation of the melcury will again befuch that all flall be in equilibrio. 1: will be a litule lower in the infide fpace and higher in the outfide.

Taking this view of things, we fee clearly how the water is upported by the atmofphere at a very con-
fidcrable lecight. The apparatus is analogons to a fyphon which has one leg filled with water and the other with mercury. But it was not neceflary to cmploy :an air-pump to fill it. Suppofe it argain cmpty, and ali the valves fhut by their own weight. Let the cylirders defcend a little. The capacity of the fpaces below the valve 1 ) is enlarged, and therefore the included air is rarefied, and fome of the air in the pipe CE mult dis: fufe itfels into the fpace quitted by the inner cylinder. Therefore the atmofphere will prefs fome water up the pipe FE, and fome mercury into the inner fpace between the cylinders. When the cylinders are raifcul again, the air which came from the pipe CE would return into it again, but is prevented by the valve C. Raifing the cylinders to their former beight would comprefs this air ; it therelore lifts the valve D, and cfcapes. Another depreflion of the cylinders will have a finilit. effect. The water will rife higher in FC, and the niercury in the inner fpace; and then, after repeated Prokes, the water will pafs the valve C, and fill the whole apparatus, as the air-pump had caufed it to do before.The pofition of the cylinders, when things are in this fituation, is reprefented in fig. 20 , the outcr and inner cylinders in their loweft pofition having defcended about 30 inches. The mercury in the outer fpace flands at $q, r$, a little above the middle of the cylinders, and the mercury in the inner fpace is near the top $t$ s of the inner cylinder. Now let the cylinders be drawn up. The water above the mercury cannot get back again through the valve C , which fhuts by its own weight. We therefore attempt to comprefs it ; but the mercury yields, and defcends in the inner fpace, and rifes in the outer till both are quickly on a level, about the height $v \%$. If we continue to raife the cylinders, the comprefiion forces out more mercury, and it now ftands nower in the inner than in the outer fpace. But that there may be fomething to balance this inequality of the mercurial columns, the water goes through the valve D , and the equilibrium is reftored when the height of the water in the pipe $12 D$ above the furface of the internal mercury is 12 times the difference of the mercurial columns (on the former fuppatition of fpecific gravity.). If the quantity of water is fuel ats to rife two feet in the pipe ED, the mercury in the outer fpace will be two inches higher than that in the inner fpace. Another depreffion of the crlinders will again enlarge the fpace within the apparatus, the mercury will take the pofition of fig. 19. and more water will come in. Kaing the cylinders will iend this water four feet up the pipe ED, and the merciry with be four inches higher in the inner than in the cute: fpace. Repeating this operation, the water will be raifed fill higher in DE; and this will go on till t..e mercury in the outer fpace reaches the top of the cy. linder; and this is the limit of the performance. The dimenfions with which we fet ont will enable the mal. chine to raife the water about 30 feet in the pipe ED; which, added to the 30 feet of CF, makes the whole height above the pit-water 6o feet. By making the cylinders longer, we increafe the height of IDD. This machine muft be worked with great attention, and bue flowly; for at the beginning of the forcing ftroke the mercury very rapidly finks in the inner fpace and rifes in the outer, and wiil daft out and be loft. Tho pre.
rump.

50
Ingenuity of the colltrivance great

51
But the advartage trifing.
vent this as much as poffible, the outer cylinder termi- fill part of the trunk. A repetition of the operation nates in a fort of cup or difh, and the inner cylinder fhould be tapered atop.
The machine is exceedingly ingenious and refined; and there is no doubt but that its performance will exceed that of any other pump which raifes the water to the fame height, becaufe friction is completely avoided, and there can be no want of tightnefs of the pilton. But this is all its advantage ; and, from what has been obferved, it is but trifing. The expence would be enormous; for with whatever care the cylinders are made, the interval between the inner and outer cylinders mult contain a very great quantity of mercury. The middle cylinder mult be made of iron plate, and muft be withous a feam, for the mercury would difiolve every fclder. For fuch reafons, it has never come into general ufe. But it would have been unpardonable to liave omitted the defcription of an invention which is fo original and ingenious; and there are fome occafions where it may be of great ufe, as in nice experiments for illuftrating the theory of hydraulics, it would give the finelt piftons for meafuring the preffures of water in pipes, \&ic. It is on precifely the fame principle that the cylinder bellows, defcribed in the article Pneumatics, are conAructed.

We beg leave to conclude this part of the fubject with the defcription of a pump without friction, which may be conftructed in a variety of ways by any common carpenter, without the affiftance of the pump-maker or plumber, and will be very effective for raifing a great quantity of water to fmall heights, as in draining marthes, marle pits, quarries, \&c. or even for the fervice of a houfe.
VII. ABCD (fig. 21.) is a fquare trunk of carpenter's work open at both ends, and having a little ciRern and fpout at top. Near the bottom there is a partition made of board, perforated with a hole $E$, and covered with a clack. ffff reprefents a long cyindrical baty or pudding, made of leather or of double canvas, with a fold of thin leather fuch as fleepikin between the canvas bags. This is firmly nailed to the board E with foft leather between. The upper end of this bag is fixed on a round board, having a hole and valve $\underset{F}{F}$. This board may be turned in the lathe with a groove round its edge, and the bayg faltened to it by a cord bound tight round it. The fork of the pifon$\operatorname{rod}$ FG is firmly fixed into this board ; the bag is kept diftended by a number of wooden hoops or rings of ffrong wire $f f, f f, f f$, \&c. put into it at a few inches diftance from each other. It will be proper to connect thefe hoops before putting them in, by three or four cords from top to bottom, which will keep them at their proper diftances. Thus will the bag have the form of a birber's bellows powder-puif. The diftance between the hoops fhould be about twice the breadth of the rim of the wooden ring to which the upper valve and pifton-rod are fixed.

Now let this trunk be immeried in the water. It is evident that if the bag be ftretched from the compreffed form which its own weight will give it by drawing up the pilton-rod, its capacity will be enlarged, the valve $F$ will be fhut by its own weight, the air in the bar will be rarefied, and the atmofphere will prefs the water into the bag. When the rod is thrult down again, this water will come out by the valve $F$, and
will have a fimilar effect ; the trunk will be filled, and the water will at laft be difcharged by the fpout.

Here is a pump without friction, and perfectly tight. For the leather between the folds of canvas renders the bag impervious both to air and water. And the canvas has very confiderable ftrength. We know. from experience that a bag of fix inches diameter, made of fail-cloth $n^{\circ} 3$. with a heep fk in between, will bear a column of is fcet of water, and fand fix loours work per day for a month without failure, and that the pump is confiderably fuperior in effeet to a common pump of the fame dimenfions. We mult only obferve, that the length of the bag mutt be three times the intended length of the ftroke; fo that when the pifton-rod is in its highelt pofition, the angles or ridges of the bag may be pretty acute. If the bag be more Atretched than this, the force which muft be exerted by the labourer becomes much greater than the weight of the column of water which he is raifing. If the pump be laid aflope, which is very ufual in thefe occafional and hafty drawings, it is neceflary to make a guide for the pi-fon-rod within the trunk, that the bag may play up and down without rubbing on the fides, which would quickly wear it out.

The expericnced reader will fee that this pump is very like that of Coffet and De la Deuille, defcribed by Belidor Vol. II. p. 120. and moft writers on liydraulics. It would be fill more like it, if the bag werc on the under fide of the partition $E$, and a valve placed farther down the trunk. But we think that our form is greatly preferable in point of ftrength. When in the other fituation, the column of water lifted by the piftun tends to burf the bag, and this with a great force, as the intelligent reader well knows. But in the form recommended here, the bag is compreffed, and the frain on each part may be made much lets than that which tends to burft a bag of fix inches diameter. The nearer the rings are placed to each other the fmaller will the ftrain be.

The fane bag-pifton may be employed for a forcing pump, by placing it below the partition, and inverting the valve; and it will then be equally ftrong, becaule the refiftance in this cafe too willat by compreffion.

We now come naturally to the confideration of the different forms which may be given to the pittons and valves of a pump. A good deal of what we have been defcribing already is reducible to this head; but, having a more general appcarance, changing as it were the whole form and the Iructure of the pump, it was not improper to keep thefe things together.

The great defideratum in a pifton is, that it be as $p$ i tightas poflible, and have as little friction as is con. Sho fiftent with this indifpenfable quality. We have al- litt ready raid, that the common form, when carefully exe- tio cuted, has there properties in an eminent degree. And accordingly this form has kept its ground amidft all the improvements which ingenions artilts have made. Mr Belidor, an author of the firft reputation, has given the defeription of a pifton which he highly extols, and is undoubtedly a very good one, confructed from principle, and extremely well compofed.

It confifts of a hollow cylinder of metal $g b$ (fig. 22.) An pierced with a number of holes, and having at top a vec flancla $A B$, whofe dimeter is nearly equal to that of Bc .

## 1 U M

the working-barrel of the pump. This flanch has a may be done with any kind of pilon; and this has groove round it. There is another flanch IK below, by which this hollow cylinder is faftened with bolts to the lower end of the pifon, reprefented in fig. 23 . This conflits of a plate CD, with a grooved edge fimilar to $A B$, and an intermediate plate which forms the feat of the valve. The compofition of this part is better underfood by infpecting the figure than by any defcription. The pifton-rod HL is fixed to the upper plate by bolts through its different branches at $G, G$. This metal body is then covered with a cylindrical bag of leather, faltencd on it by cords bound round it, filling up the grooves in the upper and lower plates. The operation of the pifton is as follows.

A little water is poured into the pump, which gets pat the fides of the pifton, and lodges below in the fixed valve. The pifton being pufhed down dips into this water, and it gets into it by the valve. But as the piton in defcending compreffes the air below it, this compreffed air alfo gets into the infide of the pifton, fiwells out the bag which furrounds it, and compreffes it to the fides of the working-barrel. When the pifton is drawn up again, it mut remain tight, becaufe the valve will fhut and keep in the air in its moft compreffed State; therefore the pifon nult perform well during the fuction. It muft act equally well when pufhed down again, and acting as a forcer; for however great the refiftance may be, it will affce the air within the pifton to the fame degree, and keep the leather clofe applied to the barrel. There can be no doubt therefore of the pifton's performing both its offices completely; but we imagine that the adhefion to the barrel will be greater than is neceffary: it will extend over the whole furface of the pifton, and be cqually great in every part of its furface; and we fufpect that the friction will there. fore be very great. We have very high authority for fuppofing that the adhefion of a pifton of the common form, carefully made, will be fuch as will make it perfeetly tight ; and it is evident that the adhefion of Belidor's pifon will be much greater, and it will be productive of worfe confequences. If the leather bag is worn through in any one place, the air efcapes, and the pifton ceafes to be compreffed altogether; whereas in the common pifton there will very little harm refult from the leather being worn through in one place, efpecially if it project a good way beyond the bafe of the cone. We ftill think the common pifton preferable. Belidor's pifton would do much better inverted as the pifton of a fucking pump; and in this fituation it would be equal, but not fuperior, to the common.

Belidor defcribes another forcing piton, which he had executed with fuccefs, and prefers to the common wooden forcer. It confifts of a metal cylinder or cone, having a broad flanch united to it at one end, and a fimilar flanch which is fcrewed on the other end. Between thefe two plates are a number of rings of leather ftrongly comprefied by the two flanches, and then turned in a tathe like a block of wood, till the whole fits tight, when dry, into the barrel. It will fwell, fays he, and foften with the water, and withftand the greateft preffures. We cannot help thinking this but an indifferent pilton. When it wears, there is nothing to fqueeze it to the barrel. It may indecd be taken out and another ring or two of lsather put in, or the flanches may be moreftrongly ferewed together : but all this
therefore no peculiar merit.

The following will, we prefume, appear vaftly pre- Another ferable, $A B C D$ ( fig. 24.) is the folid wooden or metal reconsblock of the pifton; EF is a metal plate, which is turn-mended as ed hollow or dith-like below, fo as to receive within it preferable. the folid block. The pifton rod gocs through the whole, and has a fooulder above the plate EI, and a nut H below. Four fcrew-bolts, fuch as $i k, l \mathrm{~m}$, alfo go through the whole, having their heads $k, m$ funk into the block, and nuts above at $i, l$. The packing or Atufing, as it is termed by the workmen, is reprefented at NO. This is made as folid as polfible, and generally confits of foft hempen twine well foaked in a mixture of oil, tallow, and rofin. The plate EF is gently ferewed down, and the whole is then put into the barrel, fitting it as tight as may be thought proper. When it wears loofe, it may be tightened at any time by forewing down the nuts $i l$, which caufe the edges of the difh to fqueeze out the packing, and comprefs it againft the barrel to any degree.

The greateft difficulty in the confluction of a pifton Dificulties is to give a fufficient paffage through it for the water, inconftrucand yct allow a firm fupport for the valve, and hixture ting piffor the piton rod. We thall fee prefently that it oc. ${ }^{\text {lons, }}$ cafions a confiderable cxpence of the moving power to force a pifton with a narrow ferforation through the water lodged in the working barrcl. When ve are raifing water to a fmall height, fuch as 10 or 20 feet, the power fo expanded amounts to 2 tourth part of the whole, if the water-way in the pifon is lefs than omehalf of the fection of the barrel, and the velocity of the pifton two feet p.r fecond, which is very moderate. There can be no doub:, therefore, that metal pitons are preferable, becaufe their greater ftrength allows much wider apertures.

The following pilton, defcribed and recommended Confiderby Belidor, feenis as perlect in thefe refpects as the na. ably remoture of things will allow. We thall therefore defcribe ved in one it in the author's own words as a model, which may deferibed be adopted with confidence in the greateft works.
"Thebody of the pifton is a truncated metal cone CCXX (fig. 25.) having a fmall fillet at the greater end. Fig. 26 thows the profle, and fig. 27. the plan of its upper bafe; where appears a crots bar DD , piereed with an oblong mortife $E$ for receiving the tail of the pifton-rod. A band of thich and unitorm leather AA (fig. 26. and 2S.) is put round this cone, and lecured by a brafs hoop Bl3 firmly driven on its fmaller end, where it is previoutly made thinner to give room for the hoop.
"This piton is covered with a leather valyc, fortified with metal plates GG (fig. 29.) Thefe plates are wider than the hole of the pilton, fo as to reft on its rim. There are limilar plates below the leather of a fmaller fize, that they may go into the hollow of the pifton ; and the leather is firmly held between the metal plates by fcrews H, H, which go throurh all. This is reprefented by the dotted circle IK. Thus the preffure of the incumbent column of water is fupported by the plates GG, whofe circular cdges reft on the brim of the water-way, and thus fraight edges reft on the crofs bar DD of fig. 26. and 27. This valve is laid on the top of the conical box in fuch a manner that its middle FFiefts on the crofs bar. To bind all together,

Pump.

62
Alvantages of: his pitom.

63
Another ingenious and ufeful pifton defribed.

64
Another
ona difi:e
principle.
the end of the pifton-rod is formed lise a crofs, and the arms MN (fig. 30.) are made to reft on the diameter FF of the valve, the tail EP going through the hole E in the middle of the leather, and through the mortife E of the crofs bar of the box; and alfo through another bar QR (fig. 28. and 29.) which is notched into the lower brim of the box. A key V is then driven into the hole T in the pitton-rod; and this wedges all falt. The bar $Q R$ is made Atrong; and its extremities project a little, fo as to fupport the brals hoop BB which binds the leather band to the pifton-box. The aljoining fcale gives the dimenfions of all the parts, as they were executed for a feam-engine near Condé, where the pifon gave complete fatisfaction."
This pifon has every advantage of Itrength, tightnefs, and large water-way. The form of the valve (which has given it the name of the butterfly-valve) is extremeIy favourable to the paflage of the watcr ; and as it has but half the motion of a complete circular valve, lefs water goes back while it is fhutting.

The following pifton is alfo ingenious, and has a good deal of merit. OPPO (fig. 31.) is the box of the pifton, having a perforation O , covered above with a fiat valve $K$, which refts in a metal plate that forms the top of the box. ADCBA is a Atirrap of iron to which the box is fixed by fcrews $a, a, a$, $a$, whofe heads are funk in the wood. This firrup is perforated at C, to receive the end of the pifton-rod, and a nut H is ferewed on below to keep it fall. DEFED is another ftirrup, whofe lower part at DD forms a hoop like the fole of a llirrup, which embraces a fmall part of the top of the wooden box. The lower end of the pifton-rod is ferewed; and before it is put into the holes of the two Alirrups (through which holes it flides freely) a broad nut $G$ is fcrewed on it. It is then put into the holes, and the nut $H$ firmly fcrewed up. The packing $R \mathrm{R}$ is then wound about the pilton as tight as pofible till it completcly fills the working barrel of the pump. When long ule has rendered it in any degree loofe, it may be tightened again by forewing down the nut $G$. This catufes the ring DD to comprefs the packing beiween it and the projecting thoulder of the box at Pr; and thus c.ufes it to fivell out, and apply itfelf clofely to the barrel.

We fhall add only another form of a perforated pifton; which being on a principle different from all the preceding, will fuggeft many others; each of which will have its peculiar advantages. OO in fig. $\mathbf{3}^{2}$. reprefents the bx of this fifton, fitted to the worhing barrel in any of the preceding ways as may be thought belt. AB is a crots bar of four arms, which is fixed to the top of the box. CF is the pifton-rod going through a hole in the midilie of AB, and reaching a little way beyond the bottom of the box. It has a fhoulder D, which prevents it going too far throngh. On the lower end there is a thick metal plate, turned conical on its upper fide, fo as to fit a conical feat PP in the bottom of the pifton-box.

When the pifton-rod is puthed down, the friation on the barrel prever ts the box from immediately yielding. The rod therefore fips through the hole of the crois bar AB . 'The plate E , thel efore, detacles itfelf from the box. When the floulder 1 preffes on the bar AB, the box muft sicld, and be pufhed down the barrels, and the water gets up through the perforation.

When the pifton-rod is drawn up again, the bor does not move till the plate $1:$ lodged in the feat PP, and thus fhuts the water-way; and then the pifon lifts the water which is above it, and acts as the pifton of a fucking pump.

This is a very fimple and effective conftruction, and H ;ad makes a very tight valve. It has been much recom. tages mended by engineers of the firlt reputation, and is frequently ufed; and from its fimplieity, and the .great folidity of which it is capable, it feems very fit for great works. Bat it is evident that the water-way is limited to lefs than one-lalf of the area of the workingbarrcl. For if the perforation of the pition be one-half of the area, the diameter of the plate or ball EF muft be greater; and therefore lefs than lialf the area will be left for the paffage of the water by its fides.

We come now to conlider the forms which may he otre given to the valves of a hydraulic engine.

The requifites of a valve are, that it fhall be tight, valve of fufficient frength to refitt the great preflures to which it is expored, that it afford a fufficient paflage for the water, and that it do not allow much to go back while it is fhutting.
We havenot muclis to add to what has been faid already Click on this fubjea. The valves which accompany the pump valve of fig. 5. are called clack values, and are of all the moft obvious and common; and the conftruction defribed on that occafor: is as pelfect as any. We only add, that as the leather is at late deftroyed at the hinge by fuch inceffant motion, and it is tronblefome, efpecially in deep mincs, and under water, to undo the joint of the pump in order to put in a new valve, it is frequently aunexed to a box like that of a pifton, made a little conical on the outfide, fo as to fit a conical feat made for it in the pipe, as reprefented in fig. 33. and it has an iron handle like that of a baket, by which it can be laid hold of by means of a long grappling-honk let down from above. Thus it is drawn up; and being very gently tapered on the fides, it fticks very fall in its place.
The only defect of this valve is, that by opening Defee very wide when pufhed up by the fream of water, it then allows a good deal to go back during its thutting again. In fome great machines which are worked by a flow turning crank, the rcturn of the pifon is fo very ilow, that a fenfible lofs is incurred by this; but it is nothing like what Dr Defaguliers fays, one-half of a cylinder whote height is equal to the diameter of the valve.For in fuch machines, the laft part of the upward flroke is equally flow, and the velocity of the water through the valve exceedingly fmall, fo that the valve is at this time almon fhut.

The butterfly-valve reprefented in figures 29 , \&ic. is Utili free from molt of there inconveniences, and feems the thy t moft perfees of the elack valves. Some enginecrs make fly-v: their great valves of a pyrannidal form, confiling of four clacks, whofe hinges are in the circumference of the water-way, and which meets with their points in the middle, and are fupported by four ribs ribich rife up from the fides, and unite in the middle. This is an cxcellent form, affording the moft fpacious water-waty, and fhutting very readily. It feems to be the beft poffible for a pifton. The rod of the pilton is branehed out on four fides, and the branches go through the pifton box, and are faltened below with forews. Thefe
branches form the fupport for the four clacks. We have feen a valve of this form in a pump of fix feetdi:ameter, which difcharged 20 hogheads of water every Atrcke, and made 12 Rrokes in a minute, raifing the water above 22 feet.

There is zuother form of valve, called the tution or tail value. It confifts of a plate of metal AB (fig. 34.) turned conical, fo as exaclly to fit the conical cavity $a b$ of its hox. A tail CD projects from the under fide, which paffes through a crofs bar EF in the bottom of the bnx, and has a little knob at the end, to hinder the valve from rifing too high.

This valve, when nicely made, is unexceptionable. It has great Atrength, and is therefore proper for all fevere ftrains, and it may be made perfectly tight by grinding. Accordingly it is ufed in all cales where this is of indifpenfable confequence. It is molt durable, and the only kind that will do for paflages where Ream or hot water is to go through. Its only imperfection is a fmall water-way; which, from what has been faid, camnot exceed, nor indced equal, one-half of the area of the pipe.

If we endeavour to enlarge the water.way, by giving the cone very little taper, the valve frequently Aicks fo falt in the feat that no force can detach them.And this fometimes happens during the working of the machine and the jolts and blows given to the machine in taking it to pieces, in order to difcover what has been the reafon that it has difcharged no water, frequently detaches the valve, and we find it quite loofe, and cannot tell what has deranged the pump. When this is guarded againtt, and the diminution of the wa-ter-way is not of very great confequence, this is the belt form of a valve.

A nalogous to this is the fimpleft of all valves, reprefented in fig. 35. It is nothing more than a fphere of metal A , to which is fitted a feat with a fmall portion BC of a fpherical cavity. Nothing can be more effectual than this valve; it always falls into its proper place, and in every pofition fits it exacty. Its only imperfection is the great diminution of the water-way. If the diameter of the fphere does not confiderably ex. ceed that of the hole, the touching parts have very little taper, and it is very apt to ftick faft. It nppofes much lefs refiftance to the paffage of the water than the flat under-furface of the button-valve. $N . B$. It would be an improvement of that valve to give it a taper-flape below like a boy's top. The fpherical valve muft not be made too light, otherwife it will he hurried up by the water, and much may go back while it is returning to its place.

Delidor deferibes with great minutenefs (vol. ii p. idor 22 I, \&cc.) a valve which unites every requifite. But
requi- it is of fuch nice and delicate conflrustion, and its de-
requi- feas are fo great when this exantuefs is not attained, or is impaired by ufe, that we think it hazardous to introduce it into a machine in a fituation where an intelligent and accurate artift is not at hand. For this reafon we have omitted the defcription, which cannot be given in feve words, nor without many figures; and de'ire our curious readers to confult that author, or perufe Dr Defagulier's tranflation of this paffige. Its principle is precifcly the fame with the following rude contrivance with which we thall condude the deferiptive part of this article.

Suppofe $A B C D$ (fig. 36.) to be a fquare wooden trunk. EF is a riece of oak-board, exacoly fitted to the trunk in an oblique pofition, and fupported by an Another iron pin which goes turough it at $I$, one-third of its valve on length from its lower extremity E. The two ends of the fanc this board are levelled, fo as to apply exactly to the principle. fides of the trunk. It is crident, that if a fream of water comes in the direction BA, its preffure on the part IF of this board will be greater than that upon EI. It will therefore force it up and rufh through, making it fand almoft parallel to the fides of the trunk. To prevent its riling fo far, a pin muft be pur in its way. When this current of water changes its direction, the preflure on the upper fide of the board being again greateft on the portion IF, it is forced back again to its former fituation; and its two extremities relting on the oppofite fides of the trunk, the paffage is completely itopped. This board therefore performs the office of a valve; and this valve is the molt perfeet that can be, becaule it offers the freeft palfage to the water, and it allows very little to get back while it is fhutting; for the part IE brings up half as much water as IF al. lows to go down. It may be made extremely tight, by fixing two thin fillets $H$ and $G$ to the fides of the trunk, and covering thofe parts of the board with leather which applies to them ; and in this fate it perfectly refembles Belidor's fine valve.
And this conffruction of the valve fuggefts, by the Defcription way, a form of an occafional pump, which may be of an ncquickly fet up by any common carpenter, and will be cafional very effectual in fmall heights. Let $a b$ ode (fig. 36.) he prompeafily a fquare box made to flide along this wooden trunk without flake, having two of its fides projecting upwards, terminating like the gable-ends of a houfe. A piece of wood $e$ is mortifed into thefe two fides, and to this the pitton-rod is fixed. This box being furnifled with a valve fimilar to the one below, will perform the office of a pifton. If this pump be immerfed fo deep in the water that the pifton fhall alfo be under water, we fcreple not to fay that its performance will be equal to any: The pifton may be made abundantly tight by covering its outfide neatly with foft leather. And as no pipe can be bored with greater accuracy than a very ordinary workman can make a fquare trunk, we prefume that this pump will not be very deficient even for a confiderable fuction.

We now proceed to the laft part of the fubject, to The moconfider the motion of water in pumps, in reference to tion of wathe force which muft be employed. What we have ter in hitherto faid with reffect to the force which mull be pumps applied to a pifton, related only to the fultaining the water at a certain height : but in adual fervice we muft not only do this, but we nult difcharge it at the place of delivery in a certain quantity; and this mult require a force fuperadded, to what is neceflary for its mere fupport at this height.

This is an extremely intricate and difficult fubject, An intui and very imperfectly underftood even by profeffed en- cate fubgineers. The principles on which this knowledge nouf ject. be founded are of a much more abftrufe nature than the ordinary laws of hydroftatics; and a!l the genius of Newtor was employed in laying the foundation of this part of phyfical fience. It has been much cultivated in the courfe of this century by the firf mathenaticians of Europe. Danicl and John Bernoulli have written

## P U M

Pump.
7) The theory denominated Aydro-
rery elaborate treatifes on the fubject, under the very oppofite name of Hydronynamics; in which, although they have added little or nothing to the fundamental propofitions eftablifhed in fome fort by Newton, and acquiefced in by them, yet they have greatly contributed to our progrefs in it by the methods whicle they have purfued in making application of thofe fundamental propofitions to the moft important cafes. It mult be acknowledged, however, that both thefe propolitions, and the extenfions given them by thefe authors, are fupported by a train of argument that is by no means unexceptionable; and that they proceed on affumptions or poftulates which are but nearly true in any cafe, and in many are inadmidible : and it remains to this hour a wonder or puzzle liow thefe propolitions and theit refults correfpond with the phenomena which we obferve.

But fortunately this correfpondence does obtain to a celtain extent. And it feems to be this correfpondence clicfly which has given thefe authors, with Newton at their head, the confifence which they place in their refpective principles and methods: for there are confiderable differences among them in thefe refpects; and each feems convinced that the others are in a mittake. Meffienrs d'Alembert and De la Grange have greatly correited the theories of their predeceffors, and have proceeded on potulates which come much nearer to the real ftate of the cafe. Dut their inveltigations involve us in fuch an inextricable maze of analytical inveftigation, that even when we are again conducted to the light of day by the clue which they have given us, we can make no ufe of what we there difcovered.

80
Though inperfect is very ufeful.

But this theory imperfect as it is, is of great fervicc. It generalizes our obfervations and experiments, and enables us to compore a praclical doarine from a heap of facts which otherwife nult have remained folitary and unconnected, and as cumberfome in their ap-

This propofition is Cufficient for all our purpofes. For fince water is nearly a perfect fluid, and propagates all impreffions undiminifhed, we can, in place of any preflure of a pifton or other caufe, fubftitute a perpendicular column of water whofe weight is equal to this prelfure, and will therefore produce the fome efflux.Thus, if the firrace of a pifton is half a fquare foot, and it be prefled down with the weight of 500 pounds, and we would wifh to know with what velocity it would caufe the water to flow through a fmall hole, we know that a column of water of this weight, and of half a foot bafe, would be 16 feet high. And this propofition teaches us, that a vellel of this depth will have a velocity of efflux equal to 32 feet in a fecond.

If therefore our preffing power be of fuch a kind Rem that it can continue to prefs forward the pilon with prev the force of 500 pounds, the water will flow with this velocity, whatever be the fize of the hole. All that remains is, to determine what change of achual preflure on the pifton refults from the motion of the pillon itfelf, and to clange the velocity of eflux in the fubduplicate ratio of the change of actual preffure.

But before we can apply this knowledge to the circumftances which take place in the motion of water in pumps, we mult take notice of an important modification of the fundamental propofition, which is but very obfcurely pointed out by any good theory, but is cftablifhed on the moft regular and unezceptionable oblervation.

If the efllux is made through a hole in a thin plate, and the velocity is computed as absive, we fhall difcover the quantity of water which iffues in a fecond by obferving, that it is a prifm or cylinder of the length indicated by the velocity, and having its tranfverfe fection equal to that of the orifice. Thus, in the example already given, fuppoling the hole to be a fquare inch, the folid contents of this prifm, or the quantity of water iffuing in a fecond, is $1 \times 3^{2} \times 12$ cubic inches, or $3^{S} \neq$ cubsc inches. This we can eafily meafure by receiving it in a veffel of known dimenfons. Taking this method, we uniformly find a deficiency of nearly $3^{8}$ parts in 100 ; that is, if we fhould obtain 100 gallons in any number of feconds, we fhall in fact get only 62. This is a moft regular fact, whether the velocities are great or fmall, and whatever be the fize and form of the orifice. The deficiency increafes indeed in it very minute degrec with the velocities. If, for inftance, the depth of the orifice bc one foot, the difcharge is ${ }^{6} \frac{1}{2} \frac{3}{6} \frac{3}{0}$; if it be 15 feet, the difcharge is

This deficiency is not owing to a diminution of velocity; for the velocity may be eafily and accurately meafuted by the diftance to which the jet will go, if directed horizontally. This is found to correfpond very nearly with the propofition, making a very fmall allowance for frittion at the border of the lole, and for the refiftance of the air. Sir Ifaac Newton atcribed the deficiency with great juftice to this, that the lateral co. lumns of water, furrounding the colnma which is incumbent on the orifice, preis towards the orifice, and contribute to the expence equally with that column. Thefe lateral filaments, therefore, iffue obliquely, croising the motion of the central tream, and prodice a contraction of the jet; and the whole itream docs not acquire a parallel motion and its ultimate velocity till it
has got to fome diftance from the orifice. Careful ob. fervation fhowed him that this was really the cafc. But even his genius could not enable him to afcertin the motion of the lateral filaments by theory, and he was obliged to meafure every thing as he faw it. He found the cliameter of the jet at the place of the greatelt contraction to be preciely fuch as accounted to: the deficiency. His explication has been unamimoufl acquieffed in; and experiments have been multiplied to afecrtain all thofe circumptances which our theory cannot determine á priori. The molt complete fet of experiments are thofe of Alicheloti, made at Turin at the expence of the prince of Pidmont. Here jets were made of 1 , 2,3 , and $\psi$ inches diameter ; and the water received into cifterns moft accurately formed of brick, and lined with ftucco. It is the refult of thefe experiments which we have taken for 2 meafure of the deficiency.

We may therefore confider the water as flowing through a hole of this contracted dimenfion, or fubftitute this for the real orifice in all calculations. For it is evident that if a mouth-piece (fu to call it) were made, whofe internal fhape precifely tallied with the form which the jet affumes, and if this mouth-piece be applied to the orifice, the water will flow out without any obftruction. The veffel may therefore be confidered as really having this mouth-piece.
Nay, from this we derive a very important obfervation, "that if, inflead of allowing the water to flow through a hole of an inch area made in a thin plate, we make it flow through a hole in a thick plank, fo formed that the external orifice thall have an inch area, but be widened internally agreeably to the flape which nature forms, both the velocity and quantity will be that which the fundamental propofition determines. Michelotti meafured with great care the form of the great jets of three and four inches diameter, and found that the bounding curve was an elongated trochoid. He then made a mouth-piece of this form for his jet of one inch, and another for his jet of two inches; and he found the difcharges to be 9979 and $\frac{98}{7} \frac{9}{50}$; and he, with juftice, afcribed the triffing deficiency which fill remained, partly to fristion and partly to his not having exadly fuited his mouth-piece to the natural form. We imagine that this laft circumtance was the fole caufe: For, in the firft place, the water in his experiments, before getting at his jet-holes, had to pafs along a tube of sight inches diameter. Now a jet of four inches bears too great a proportion to this pipe ; and its narrownefs undoubedly hindered the lateral colmuns from contributing to the efllux in their due proportion, and therefore rendered the jet leis convergent. And, in the next place, there can be no doubt (and the obfervations of Daniel Bernonlli confirm it) but that this convergency begins within the veffel, and perhaps at a very confiderable diftance from the orifice. And we imagine, that if accurate obfervations could be made on the motion of the remote lateral particles within the velfel, and an internal mouth-piece were fhaped according to the curve which is defcribed by the remotelt particle that we can obferve, the efilux of water would almolt perfectly tally with the theory. But indeed the coincidence is already fufficiently near for giving us very valuable information. We learn that the quantity of water which flows through a hole, in confcquence of its own weight, or by the action of any force, may be Vol.XV.
increafed one half by properly fhaping the paffage to this hole; for we fee that it may be increafed frem 62 to near 99 :

But there is another modification of the eflux, which we confefs our total incapacity to cxplain. If the water iffues through a hole made in a plate whofe thicknefs is about twice the diameter of the lole, or, to exprefs it better, if it iffues through a pipe whofe length is about twice its diameter, the quantity dilcharged is nearly $\because$ of what relults from the propofition. If the pioe be longer than this, the quantity is diminifhed by friction, which increafes as the length of the pipe increafes. If the pipe be Thorter, the water will not fill it, but detaches itfelf at the very entry of the pipe, and flows with a contrated jet. When the pije is of this length, and the extrenity is fopped with the finger, fo that it begins to flow with a full mouth, no fublequent contraction is ubferved; but mercly friking' on the pipe with a key or the knuckle is general! $y$ fufficient to detach the water in an inftant from the fides of the pipe, and reduce the eflux to $\because=$

This effect is mot unaccountable. It certainly arifes from the mutual adhefion or attraction between the water and the fides of the pipe; but how this, acting at right angles to the motion, fhould produce an increafe from $6_{2}$ to $8_{2}$, nearly $\frac{\frac{\pi}{3} \text {, we cannotexplain. It }}{}$ fhows, however, the prodigious force of this attraction, which in the fpace of two or three inches is able to communicate a great velocity to a very great body of water. Indeed the experiments on capillary tubes how that the mutual attraction of the parts of water is fome thoufands of times greater than their weight.

We have only further to add, that every increafe of pipe beyond two diameters is accompanied with a diminution of the difcharge ; but in what ratio this is diminifhed it is very difficult to determine. We fhall only obferve at prefent that the diminution is vary great. A pipe of $z$ inches diameter and 30 feet long has its difcharge only ${ }^{7^{3} 5^{4} 5}$ of what it would be if only 4 inches long. If its length be 60 feet, its difcharge will be no more than ${ }^{3} 3$. A pipe of 1 inch diameter
 fituation. Hence we may conclude that the difcharge of a 4 inch pipe of 30 feet long will not exced $\frac{1}{3}$ of what it would be if only 8 inches long. 'This will ${ }^{3}$ fuffice for our prefent purpofes; and the determination of the velocities and difcharges in long conduits from pump-machines mult be referred to the article $W_{A T E R}$ Works. At prefent we fhall confine our attention to the pump itfelf, and to what will contribute to its improvement.

Before we can procced to apply this fundamental propofition to our purpofe, we mult anticipate in a loofe way a propofition of continual ufe in the conftruction of W ATER-Works.

Let water be fuppofed fagnant in a veffel EFGH (fig. 37.), and let it be allowed to flow nut by a cylindrical pipe HIKL, divided by any number of partitions $B, C, D$, \&c. Whatever be the areas $B, C, D$ of thefe orifices, the velocity in the intermediate parts of the pipe will be the fame; for as much palfes through any one orifice in a fecond as palfes through iny other in the fame time, or through any fection of the intervening pipe. Let this velocity in the pipe be $V$, and let the area of the pipe be $A$. The velocity in the ori-
fices
$\underbrace{\text { Yump. }}$
fices $I, C, D$, muit be $\frac{V A}{B}, \frac{V A}{C}, \frac{V A}{U}$, sic. Let $g$ be the velocity acquired in a fecond by a heary body. Then, by the general propofition, the height of water in the veffel which will procuce the velocity $\frac{V A}{B}$ in the firt orifice alone, is $\frac{\mathrm{V}^{2} \mathrm{~A}^{2}}{2 g B^{3}}$. After this paftage the velocity is again reduced to $V$ in the middle of the fpace between the firft and fecond orifices. In the fecond orifice this velocity is changed to $\frac{V A}{C}$. This alone would have required a height of water $\frac{\mathrm{V}^{2} \mathrm{~A}^{2}}{2 g \mathrm{C}^{2}}$. But the water is already moving with the velocity $V$, which would have refulted from a height of water in rellel (which we fhall, in the language of the art, call the hEAD of Water) equal to $\frac{V^{2}}{2 g}$. Therefore there is only required a head of water $\frac{\mathrm{V}^{2} \mathrm{~A}^{2}}{2 \mathrm{C}^{2}}-\frac{\mathrm{V}^{2}}{2 g}$, or $\frac{V_{1}}{g} \times \frac{A^{2}}{C^{2}}-1$. Therefore the whole height neceffary for producing the efflux through both orifices, fo as fill to preferve the velocity $V$ in the intervening pipe, is $\frac{V^{2}}{2 g} \times \frac{A^{2}}{B^{2}}+\frac{A^{2}}{C^{2}}-I$. In like manner the third orifice $D$ would alone require a head of water $\frac{V^{2}}{2 g} \times \frac{\overline{A^{2}}-1}{D^{2}}-1$; and all the three would require a head $\frac{V^{2}}{2 g} \times \frac{A^{2}}{B^{2}}+\frac{A^{3}}{C}+$ $\overline{A^{2}}-2$. By this induction may eafily be feen what head is neceffary for producing the efflux through any number of orifices.

Let the expence or quantity of water difcharged in an unit of tinie (fuppofe a fecond) be expreffed by the fymbol $Q$. This is meafured by the produet of the velocity by the area of the orifice, and is therefore $=V A$, or $\frac{V A}{B} \times D$, or $\frac{V A}{C} \times C, \& c$. and $V^{2}=\frac{Q^{2}}{A^{2}}$. Therefore we may compute the head of water (which we thall exprefs by $H$ ) in reference to the quantity of water difcharged, becaufe this is generally the interelting circumftance. In this view we have $H=\frac{Q^{2}}{2 g A} \times$ $\frac{A^{2}}{D^{2}}+\frac{A^{2}}{C^{2}}+\frac{A^{2}}{D^{2}}-2:$ which fnows that the head of water neceflary for producing the difcharge increafes in the proportion of the fquare of the quantity of water which is diflararge.t.

Thefe things being premifed, it is an eafy matter to determine the motion of water in a pump, and the quantity difcharged, refulting from the action of any force on the piton, or the force which mutt be applied to the pilton in order to produce any required motion or quantity difcharged. We have only to fuppofe that the force employed is the preffure of a column of water of the diametcr of the working barrel; and this is over
and above the force which is neceffary for merely fup. porting the water at the height of the place of delivery. The motion of the water will be the fame in both cafes.
Let us, firf of all, conflder a fucking-pump. The In the metion here depends on the preffire of the air, and will fuckin be the fame as if the pump were lying horizontally, and pump commonicated with a relervoir, in which is a head of water fufficient to overcome all the obftructions to the motion, and produce a velocity of efflux fuch as we defire. And here it muft be noted that there is a limit. No velocity of the pifton can make the water rife in the fuction-pipe with a greater velocity than what would be produced by the preffure of a column of water 33 feet high ; that is, about 46 fcet per fecond.

Let the velocity of the pifton be $V$, and the area of the working barrel be A. Then, if the water fills the barrel as falt as the pifton is drawn up, the difcharge during the rife of the pifton, or the number of cubic feet of water per fecond, mult be $=\mathrm{V} \times \mathrm{A}$. This is always fuppofed, and we have already afcertained the circumfances which enfure this to happen. If, therefore, the water arived with perfect freedom to the pifton, the force neceflary for giving it this velocity, or for difcharging the quantity $\mathrm{V} \times \mathrm{A}$ in a fecond, wonld be equal to the weight of the pillar of water whofe heighe is $\frac{\mathrm{V}^{2}}{2 g}$, and bafe $A$.

It does not appear at firft fight that the force neceflay for producing this difcharge has any thing to do with the obftructions to the afcent of the water into the pump, becaufe this is produced by the prelfure of the atmofphere, and it is the action of this preffure which is meafured by the head of water neceflary for producing the internal motion in the pump. But we muit always recollect that the piton, before bringing up any water, and fupporting it at a certain height, was prelfed on buth fides by the atmof here. While the air fupports the columin below the pifton, all the preflure expended in this fupport is abftracted from its prelfure on the under part of the piton, while its upper part fill fupports the whole frelfure. The atmolphere contiunes to prefs on the under furface of the pillon, through the intermedium of the water in the fuction-pipe, with the difference of thefe two forces.-Now, while the pifton is drawn up with the velocity V , more of the atmofpheric preffure muft be expended in caufing the water to follow the pifton ; and it is only with the remainder of its whole preflure that it continues to prefs on the under fusface of the pifton. Therefore, in order that the pifon may be raifed with the velocity $V$, a force muft be applied to it, over and above the force neceflary for merely fupporting the column of water, equal to that part of the atmofpheric preflure thus employed; that is, equal to the weight of the head of water neceffary for forcing the water up though the fuction-pipe, and producing the velocity $V$ in the working barrel.

Therefore Let B be the area of the mouth of the fuction-pipe, and C the area of the fixed valve, and let the fuction-pipe be of equal diamcter with the working barrel. The head neceflary for producing the velocity V on the working barrel is $\frac{V^{2}}{2 g}\left(\frac{A^{2}}{B^{2}}+\frac{A^{2}}{C^{2}}-1\right)$. If $d$ exprefs the denfity of watcr; that is, if $d$ be the number
will exprefs the weight of a celumn whofe bare is $\bar{A}$, and height $\frac{\mathrm{V}^{\mathrm{s}}}{2 g}$, all being reckoned in fect. 'Therefore the force which mutt be applied, when eftimated in pounds, will be $p,=\frac{d A V^{2}}{2 g}\left(\frac{A^{3}}{1^{2}}+\frac{\mathrm{A}^{2}}{\mathrm{C}^{2}}-1\right)$

The firf general oblervation to be made on what has been faid is, that the power which mult be employed to produce the necelfary motion, in oppofition to all the obitarles, is in the proportion of t:e fquare of the vclocity which we would produce, or the fquare of the quantity of water we would difcharge.

We lave hitherto proceeded on the fuppofition, that there is no contration of the jet in paffing through thefe two orifices. This we know would be very far from the truth. We muft therefore accommodate things to thefe circumfances, by diminifhing B and C in the ratio of the contraction, and calling the diminifhed areas $b$ and $c$; then we have $p=\frac{A d V^{2}}{2 g}\left(\frac{A^{3}}{b^{2}}+\frac{A^{2}}{c^{2}}-1\right)$.

What this diminution may be, depends on the form of the parts. If the fixed valve, and the entry into the pump, are fimply holes in thin plates, then $b={ }^{6}{ }_{\sigma}^{\circ} \sigma$ $B$ and $c=\div C$. The entry is commonly widened or trumpet fhaped, which diminifhes greatly the contrac. tion: but there are other obftacles in the way arifing from the Itrainer ufually put round it to keep out filth. The valve may have its contraction greatly diminifhed alfo ho its box being made bell-fhaped internally; nay, even giving it a eylindrical box, in the manner of fig. 33 . is better than no box at all, as in fig. 5.; for fuch a cylindrical box will have the unaccountable effect of the
 Thus we fee that circumfances feemingly very trifing may produce great effects in the performance of a pump. We fhould have obferved that the valve ittelf prefents an obftacle which diminifhes the motion and requires an increafe of power ; and it would feem that in this refpect the clack or butterlly valve is preferable to the button valve.

Example. Suppofe the velocity of the pifton to be 2 feet or 24 inches per fecond, and that the two contracted areas are each $\frac{x}{5}$ of the area of the pump, which is not much lefs than what obtains in ordinary pumps. We have $\frac{\mathrm{V}^{2}}{2 g}\left(\frac{A^{2}}{b^{2}}+\frac{\mathrm{A}^{2}}{c^{2}}-1\right)=\frac{5}{7} \frac{6}{80}(25+25-1)$ $=36,75$ inches, and the foree which we mult add to What will merely fupport the column is the weight of a pillar of water incumbent on the pifon, and fomething more than three feet high. This would be a fenfible portion of the whole force in raifing vater to fmall heights.
We have fuppofed the fuction-pipe to be of the fame diameter with the working barrel ; but it is ufual to make it of fmaller diameter, generally equal to the water way of the fixed valve. This makes a confiderable change in the foree neceffary to be applied to the pifton. Let $a$ be the area of the fuction-pipe, the area of the entry being ftill B ; and the equivatent entry without contraction being fill $b$, we have the velocity at whe entrance $=\frac{A V}{b}$, and the producing head of water $=$
the fugion-pipe, with which the water arrives at the valve, where it is again changed to $\frac{A V}{c}$ and iequires for this change a hcad of water equal to $\frac{A^{2} V^{2}}{2 \sigma^{2}} C^{2}$. But the velocity retained in the furtorn-pipe is equivalent to the effeet of a head of water $\frac{A^{2} V^{3}}{2 g a^{2}}$. Therefore the head neceifiry for producing fuch a current through the fixed valve, that the water may follow the pifton with the velocity $V$, is $\frac{A^{2} V^{2}}{2 g b^{2}}+\frac{A^{2} V^{2}}{2 g c^{2}}-\frac{\dot{\Lambda}^{2} V}{2 V^{2} a^{2}}$, or $=$ $\frac{\mathrm{V}^{2}}{2 g}\left(\frac{\mathrm{~A}^{2}}{b^{2}}+\frac{A^{2}}{c^{2}}-\frac{A^{2}}{a^{2}}\right)$. This is evidently lefs than before, becaute $a$ is lefs than $A$, and therefore $\frac{A^{2}}{a^{2}}$ is greater than unity, which was the laft term of the former formula. There is fome advantage therefore, derived from making the diameter of the futtion-pipe lefs than that of the working barrel : but this is only becaufe the palfige of the fixed valve is fmatler, and the infpection of the formula plainly points out that the area of the fuction-pipe fhould be equal to that of the fixed valve. When it is larger, the water mult be accelcrated in its paflage through the valve; which is an uielefs expence of force, becaufe this velocity is to be immediately reduced to $V$ in the working-barrel. If the foregoing example be computed with a equal to $-\frac{1}{4}$ of $A$, we fhall find the head $H$ equal to 29 inches inftead of 37 .

But this advantage of a fmaller fuction-pipe is in all cafes very moderate; and the pump is always inferior to one of uniform dimenfions throughout, having the orifice at the fixed valve of the fame area. And if thefe orifices are confiderably diminithed in any proportion, the head neceffary for overcoming the obtacles, fo that the required velocity $V$ may fill be produced in the working barrel, is greatly increafed. If we fuppofe the ared a $\frac{1}{y}$ of A , which is frequently done in houfe pumps, where the diameter of the fuction-pipe does feldom cx ceed $\frac{7}{3}$ of that of the working-barrel; and fuppofe every thing made in proportion to this, which is alfo ufual, becaufe the unfkilled pump-makers fudy a fymmetry which fatisfies the eye; we thall find that the pump taken as an example will require a head of water $=$ 13 feet and upwards. Befides, it mult be obferved that the friction of the fuction-pipe itfelf has not been taken into the account. This alone is greater, in moft cafes, than all the obtructions we have been fpeaking of; for if this pipe is three inches diameter, and that of the working-barrel is fix, which is reckoned a liberal allowance for a fuction-pipe, and if the fixed valve is 25 feet above the furface of the pit-water; the frition of this pipe will amount to one-third of the whole propelling force,

Thus we have enabled the reader to afcertain the force neceffary for producing any required difcharge of water from a pump of knowi dimentions: and the converfe of this determination gives us the difcharge which will be produced by any given force. For madking $\frac{A^{2}}{b^{2}}+\frac{A^{2}}{c^{2}}-\frac{A^{2}}{a^{2}}$, (which is a known quantity, refulting from the dimenfions of the pump) $=\mathrm{M}$, we 4 P2 have

Tunp. lave $\mathrm{H}=\frac{\mathrm{V}^{3}}{2_{S}} \mathrm{M}$, and $\mathrm{V}^{3}=\frac{2.3 \mathrm{H}}{\mathrm{M}}$, and $\mathrm{V}=$ $\sqrt{\frac{2 g \mathrm{H}}{\mathrm{M}}}$. Now H is that part of the natural power which we have at command which exceeds what is neceflary for merely fipporting the column of water. Thus, if we have a pump whofe pifton has an area of ? of a fquare foot, its diameter being $6 \frac{3}{5}$ inches; and we have to raife the water 32 feet, and can apply a power of 525 pounds to the piton; we wifh to know at what rate the pifton will be moved, and the quantity of water difcharged? Merely to fupport the column of water of this height and diameter, requires 500 poinds. Therefore the remaining power, which is to produce the motion, is 25 pounds. This is the weight of a column I foot 4 inclees high, and $\mathrm{H}=1,333$ feet. Let us fuppofe the diameter of the funtion-pipe $\frac{5}{9}$ of that of the working-barrel, fo that $\frac{A}{B}=4$. We may fuppofe it executed in the beft manner, having its lower extremity trumpet-fhaped, formed by the revolution of the proper trochoid. The contradion at the entry may therefore be confidered as nothing, and $\frac{A}{b}=4$, and $\frac{A^{2}}{b^{2}}$ $=16$. We may alfo fuppofe the orifice of the fixed valve eçual to the area of the fuction-pipe, fo that $\frac{\mathrm{A}^{2}}{\mathrm{C}^{2}}$ is alfo $=16$, and there is no contraction here; and therefore $\frac{A^{2}}{c^{3}}$. is alfo 16 . And laftly, $\frac{A^{2}}{a^{2}}$ is alfo 16 . Therefore $\frac{\mathrm{A}^{2}}{b^{2}}+\frac{\mathrm{A}^{2}}{c^{2}}-\frac{\mathrm{A}^{2}}{a^{2}}$ or $\mathrm{M},=16+16-16$, $=16$. We have alfo $2 g=64$. Now $V=\sqrt{\frac{2 g H}{M} \times 1,3,3}$ $=\sqrt{\frac{64 \times 1,333}{16}}=2,309$ feet, and the pifton will move with the velocity of 2 feet 4 inches nearly. Its velocity will be lefs than this, on account both of the friation of the pifton and the friction of the water in the fution-pipe. Thefe two circumftances will probably reduce it to one foot eight inches; and it can hardly be lefs than this.
We have taken no notice of the friction of the water in the working-barrel, or in the fpace above the pifton; becaufe it is in all cafes quite inflignificant. The longeft pipes employed in our deep mines do not require nore than a few inches of head to overcome it.

But there is another circumfance which muf not be omitted. This is the reffitance given to the pifton in its defcent. The pitons of an engine for drawing water from deep mines muft defcend again by their own weight in order to repeat their ftroke. This mult re. yuire ? preponderance on that end of the working-beam to which they are attached, and this munt be overcone liy the moving power during the effective ftrole. It makes, therefore, part of the whole work to be done, and mult be added to the weight of the column of water which mulf be raifed.

This is very eafily afcertained. Let the velocity of the pifton in its defient be $V$, the area of the pumpbarrel A, and the arca of the pilfon-valve $a$. It is evident, that while the pifton defcends with the velocity V, the water which is difplaced by the pifton in a frcond is (A-a) V. This mult pals througla the hole
of the pifton, in order to occupy the fpace above, which is left by the pifton. If there wete no contraction, the water would go thro' with the velocity $\frac{\mathrm{A}-a}{a} \mathrm{~V}$; but as there will always be fome contraction, let the diminifhed area of the hole (to be difcovered by experiment) be $b$; the velocity therefore will be $\mathrm{V} \frac{\mathrm{A}-a}{b}$. This requires for its production a head of water $\frac{V^{z}}{2_{g}^{g}}\left(\frac{A-a}{b^{2}}\right)^{2}$. This is the height of a column of water whofe bafe is not A but $\mathrm{A}-a$. Calling the denfity of water $d$, we have for the weight of this column, and the force $p$ is $d \times \overline{\mathrm{A}-a} \times\left(\frac{\mathrm{A}-a^{2}}{b}\right)^{2} \times \frac{\mathrm{V}^{2}}{2 g^{2}},=\frac{d^{2}(\lambda-a)^{3}}{2 g^{2}}$. This we fee again, is proportional to the fquare of the velocity of the pifon in its defcent, and has no relation to the height to which the water is raifed.

If the pifton has a hutton valve, its furface is at leaft equal to $a$; and therefore the preffure is exerted on the water by the whole furface of the pifton. In this cafe we flall have $p=\frac{d V^{2} A^{3}}{2 g b^{2}}$ confiderably greater than before. We cannot afcertain this value with great precifion, bccaufe it is extremely difficult, if poffible, to determine the refiftance in fo complicated a cale. But the formula is exact, if $b$ can be given exacly; and we know within very moderate limits what it may amount to. In a pump of the very beft conftruction, with a button valve, $b$ cannut exceed one-half of A; and therefore $\frac{A^{3}}{b^{2}}$ cannot be lefs than 8 . In this cafe, $\frac{\mathrm{V}^{2} \mathrm{~A}^{3}}{2 g b^{2}}$ will be $\frac{\mathrm{V}^{2}}{8}$. In a good feam-engine pump V is about three feet per fecond, and $\frac{\mathrm{V}^{2}}{8}$ is about $\mathrm{I} \frac{7}{8}$ feet, which is but a fmall matter.

We have hitherto been confidering the fuckingpump alone : but the forcing pump is of more importance, and apparently more difficult of inveftigation.Here we have to overcome the obftraction in long pipes, with many bends, contractions, and other obitructions. But the confideration of what relates merely to the pump is abundantly fimple. In moft cafes we have only t.) furce the water in an air-veffel, in oppoftion to the cianticity of the air compreffed in it, and to fend it thither with a eertain velocity, regulated by the quantity of water difcharged in a given time. The elaftieity of the ai: in the air-veffel propels it along the Main. We are not now fpeaking of the force neceffary for counterbalancing this preflure of the air in the air.veffel, wobich is equivalent to all the fublfoquent stifructions, but onl; of the force neceffary for propolling the water ont of the pump with the proper velocity.

We have in a manner determined this already. The pifton is folid, and the water which it furces has to pafs through a valve in the lateral pipe, and then to move in the direction of the Main. The change of direction requires an andition of force to what is neeeff.ury for merely impeling the water through the valvc. Its quantity is not eafily determined by any theory, and it varies according to the abruptnefs of the turn. It appears from experiment, that when a pipe is bent to a right : fngle, withnut any curvatare or rounding, the velocity is diminihed about is. This would aug-
men? ment the head of water about $\frac{7}{y}$. This may be added to the contraction of the valve hole. Let $c$ be its natural area, and whatever is the contradion competent to its form increafe it ty, and call the contrated area c. Then this will require a head of water $=\frac{V^{2} A^{2} \text {. }}{2 g c^{2}}$ This mult be addecl to the head $\frac{V}{2 g}$, neceffary for merely giving the velocity V to the water. Therefore the whole is $\frac{V^{2}}{2 g}\left(\frac{A^{2}}{c^{2}}+1\right)$; and the power $p$ neceffary for this purpofe is $\frac{d A V^{3}}{2 g}\left(\frac{A^{2}}{c^{2}}+1\right)$.

It cannot efape the obfervation of the reader, that in all thefe formulx, expreffing the height of the column of water which would produce the velocity $V$ in the working barrel of the pump, the quantity which multiplies the confant factor $\frac{d A V^{2}}{2 g}$ depends on the contracted paffiges which are in different parts of the pump, and increafes in the duplicate proportion of the fum of thofe contrations. It is therefure of the utmof confequence to avoid all fuch, and to make the Main which leads from the forcing-pump equal to the working barrel. If it be only of half the diameter, it has but one-fourth of the area, the velocity in the Main is four times greater than that of the pilion, and the force neceflary for difcharging the fame quantity of water is 16 times greater.

It is not, however, pofible to avoid thefe contractions altogether, without making the main pipe wider than the barrel. For if only fo wide, with an entry of the fame fize, the valve makes a confiderable obftuction. Unkilful engineers endeavour io obviate this by making an cnlargement in that part of the Main which coutains the valve. This is feen in fig. 14. at the valve L. If this be not done with great judgment, it will increafe the nbflructions. For if this enlargement is full of water, the water mult move in the direction of its axis with a diminifhed velocity; and when it comes into the main, it muft again be accelerated. In Short, any abrupt enlargement which is to be afterwards contrated, does as much harm as a contraction, unlefs it be fo fhort that the water in the axis keeps its velocity till it reaches the contradion. Nothing would do more fervice to an artif, who is not well founded in the theory of hydrodyuamics, that to make a few fimple and cheap experiments with a velfel like that of fig. 37. Let the horizontal pipe be about three inches diameter, and made in joints which can be added to each other. Let the j ints be about fix inches long, and the holes from one-fourth to a whole inch in diameter. Fill the veffel with water, and obferve the time of its finking three or four inches. Each joint flould have a fmali hi le in its upper fide to let nut the air; and when the water runs out by it, let it be fopped by a peg. Ihe will fee that the larger the pipe is in proportion to thac orifices mude in the partitions, the efflux is more dimiwifled. We believe that no perfon would fufped this whe has not confidered the fubjeet ninutely.

All angular enlargements, all boxes, into which the pifts frum differcnt werking barrel:, unite heie water before it gecs into a Main, muft therefore te avoided by an attil who would execute a good machire; and the different contractions which are uravoidable at
the feats of valves and the perforations of pifons, \&ec. thould be diminifhed by giving the parts a trumpet-hape.
In the air-veffels reprefented in fig. 13. this is of very great confequence. The throat 0 , through which the water is forced by the expantion of the conined air, flould always beformed in this manner. For it is this Which produces the motion during the returning fart of the ftroke in the pump confledited like fig. 13. $n^{4} 1$. and daring the whole flroke in $n^{\circ}$ 2. Neglecting this feemingly trifling circumftance will diminith the performance at leatt one-fifth. The conftruction of $n^{\circ}$, is the beft, for it is hardly poffible to make the paffage of the other fo free from the effeds of contraction. The motion of the water during the returning ftroke is very much contorted.

There is one circumf:ance that we have not taken Acceleraany notice of, viz. the gradual acceleration of the mo- tion of the tion of water in pumps. When a force is applied to the motion of pillon, it does not in an inftant communicate all the ve- water in locity which it acquires. It acts as gravity acts on punips. heavy bodies; and if the refiftances remained the farre, it unild produce, like gravity, an uniformly accelerated motion. But we have feen that the refiftances (v:hich are alvays meafured by the force which juft overcomes them) increafe as the fquare of the velocity increafes. They therefore quickly balance the action of the mo. ving power, asd tice motion becomes uniferm, in a time fo flart that we commit no error of any confequence by fuppofing it uniform from the beginning. It wonld have prodigiounly embarraffed our inveftigations to have introduced this circumfance; and it is a matter of mere fpeculative curiofity : for molt of our moving powers are unequal in their exertions, and thefe excrtions are regulated by other laws. The preflure on a pifton moved by a crank is as variable as its velocity, and in molt cafes is nearly in the inverfe proportion of its velocity, as any mechanician will readily difcover. The only cafe in which we conld confider this matter with any degrce of comprehenfibility is that of a fteam. engine, or of a pifon which forces by means of a weight lying on it. In both, the velocity becomes uniform in a very fmall fraction of a fecond.

We have been very minute on this fubject. For al- Deficiency though it is the only vicw of a pump which is of of elenenany importance, it is hardly ever underftoed even by profeffed engineers. And this is not peculiar to hydraulics, but is feen in all the branches of practical mechanics. The elementary knowledge to be met with in fucly books as are generally perufed by them, goes no farther than to fate the forces which are in equilibrio by the intervention of a machine, or the proportion of the parts of a machine which will fet two known forces in equilibrio. But when this equilibrium is deftroyed by the fuperiority of one of the forces, the machine maft move; ath the only interelting queftion is, wulat weill be the motion? Till this is awivered with fume precifion, we have learmed nothing of any importance. Few cngincers are able to anfwer this queftion cven in the fimplett cafes; and they cannot, from any confident feience, fay vilat will be the performance nit an untried machine They geets at it with a fuccefs propertioned to the multiplicity of their experience and their own fagacity. Yet this part of mechanics is as fufceptible of accurate computation as the cafes of eq̧uilibrium.We therfore th:onght it our duty to point ont the maoner of prosecding fo circumftantially, that every
tary books on this fubjcat.

## PUN

fep flould be plain and eafy, and that ennviction fhould always accompany our progrefs. This we think it has been in our power to do, by the very fimple method of fublituting a column of water acting by its weight in lieu of any natural power which we may chance to cmploy.

To fuch as wifh to profente the fudy of this important part of hydraulics in its moit abltrufe parts, we recommend the peruf:l of the difiertations of Mr Pitot and Mr Boffitt, in the Memoirs of the Academy of Paris; alfo the diflertations of the Chevalier De la Borda, 1766 and 1767 ; alfo the Hydraulique of the Chevalier De Buat. We fhall have orcation to confider the motion of the water in the mains of forcing or liftiug pumps which fend the water to a diftance, in the aricle $W_{\text {fitfR-W }}$ Works; where the reader will fee how firall is the performance of all hydraulic machines, in comparifon of what the ufual theoriss, foundedon equilibrium only, would make him expect

PUN, cr PUNN, an expreflion where a rord has at once different meanings. The pratice of punning is the miferable refuge of thofe who wifh to pafs for wits, without having a grain of wit in their compofition.James the I. of England delighted in punning ; and the talte of the fovertign was fudied by the courtiers, and even by the clergy. Hence the fermons of that age abound with this ipecies of falle wit. It continued to be more or lefs fallionable till the reign of Queen Amne, when Addifon, Swift, Pope, and Arbuthnot, with the other real wits of that clallical age, united cheir efforts to banifh punning from polite compofition. It is fill admitted fparingly in converfation ; and no one will deny that a happy pun, when it comes unfought, contributes to excite mirth in a company. A profef fed punfler, however, who is always pouring forth his fenfele's quibbles, as Sancho Panca poured forth his proverbs, is fuch an intolerable nuifance in fociety, that we do not wonder at Pope or Swift having written a pamphlet with the title of God's Revenge againf Punning.

PUNCH, an infrument of iron or fteel, ufed in feveralart,, for the piercing or flamping holes in plates of metals, \&c. being fo contrived as not only to perforate, but to cut out and take away the piece. The punch is a principal intrument of the metal-button makers, hoc-makers, \&c.

Punch is alfo a name for a fort of compound drink, much ufed here, and in many parts abroad, particularly in Jamaica, and feveral other parts of the WeltIndies.

Its bafis is fpring water; which being rendered cooler, brifker, and more acid, with lemon or lime juice, and fiweetened again to the palate with fine fugar, makes what theycall herbet ; to which a proper quantity of fpirituous liquor, as brandy, rum, or arrack, being added, the liquor becomes punch.

PUNCHEON, Punchin, or Punchion, a little block or piece of fleel, on one end whereof is fome figure, letter, or mark, engraven either in creux or relievo, impreflions whereof are taken on metal, or fome other matter, by ftriking it with a hammer on the end not engraved. There are various kinds of thefe puncheons ufed in the mechanical arts; fuch, for initance, are thofe of the goldfmiths, cutlers, pewte:ers, \&c.

The puncheon, in coining, is a piece of iron fteeled,
whereon the engraver has cut in relicvo, the feveral figurcs, arms, effigy, infeription, \&c. that there are to be in the matrices, wherewith the foecies are to be marked. Minters ditinguifh three kinds of puncheons, according to the three kinds of matrices to be made; that of the effigy, that of the crofs or arms, and that of the legend or infeription. The firf includes the whole portrait in :elievo; the fecond are fmall, fuch only containing a piece of the crofs or arms; for intance, a fleur-de-lis, an harp, a coronet, \&c. by the affemblage of all which the entire matrice is formed. The puncheons of the legend only contain each one letter, and ferve equally for the legend on the effigy fide and the crofs fide. See the article Coinage.

For the puncheons ufed in ftamping the matrices wherein the types of printing characters are caft, fee Letter-Foundert.

Puncheon is alfo ufed for feveral iron tools, of various fizes and figures, ufed by the engravers en creux on metals. Seal-gravers particularly ufe a great number for the feveral pieces of arms, \&c. to be engraven, and many ftamp the whole feal from a fingle puncheon.

Punchson, is alfo a common name for all thofe iron inflruments ufed by fone-cutters, fculptors, blackfmiths, \&c. for the cutting, inciding, or piercing their feveral matters.

Thofe of feulptors and ftatuaries ferve for the repairing of flatues when taken out of the moulds. The lockfiniths ufe the greatelt variety of puncheons; fome for piercing hot, others for piercing cold ; fome flat, fome fquare, fome round, others oval, each to pierce holes of its refpective figure in the feveral parts of locks.

Puncheon, in carpentry, is a piece of timber placed upright between two pofts, whofe bearing is too great ; ferving, together with them, to fuftain fome large weights.

This term is alio ufed for a piece of timber raifed upright, under the ridge of a building, wherein the legs of a couple, \&c. are jointed.

Puncheon, is alfo the name of a meafure for liquids. Rum is brought from the Weft Indies in puncheons, which are large cafks containing about 130 gallons.

PUNCTUATION, in grammar, the art of peinting, or of dividing a difcourfe into periods, by points exprefsing the paufes to be made therein.
The points ufed are four, viz. the period, colon, femi-colon, and comma. See the particular ufe of each under its proper article, Comma, Colon, Period, and Semi-colon.
In the general, we flall only here obferve, that the comma is to diftinguith nouns from nounc, verbs from verbs, and fuch other parts of a period as are not neceffarily joined together.- The femi-colon ferves to fufpend and fuitain the period when too long:the colon, to add fome new, fupernumerary reafon, or confequence, to what is already faid :-and the ped riod, to clofe the femfe and conftruction, and releafe the voic.

Punfuation is a modern art. The ancients were entirely unacquainted with the ufe of our commas, colons, \&cc. and wrote net only wibhout any diftintion of members and periods, but alfo without diftinction of words

## P U N

PunQua- words: which cuftom, Lipfius obferves, continned till tion. the hundred and fourth Olympiad; during which time the fenfe alone divided the difcourfe.
What within our own knowledge at this day puts this beyond difpute, is the Alcxandrian manufript, which is at prefent in the king's library at the lhitilh Mufxum. Whocver examines this, will find, that the whole is written coninuo dutiu, without ditination of words or fentences. How the ancients read their works written in this manner, it is not eafy to conceive.
After the practice of joining words together ce:ifed, notes of diftinction were placed at the end of every word. In all the editions of the Fafi Capitolini thefe pointsoccur. The fame are to be feen on the Columna Rofrata. For want of thefe, we find much confufion in the Cbronicon Marmoreuin, and the covenant between the Smyrnæans and Magnefians, which are both now at Oxford. In Salmafins's edition of Dedicatio flatue risille Herodis, the lise confufion occurs, where we find $\triangle$ ETPTTE and $\Delta s v_{\text {it }}$ ite.

Of thefe marks of diftinction, the Walcote infcription found near Bath may ferve for a fpecimen :

> IVLIU Sv VITALISv FABRI
> CESISv LEGv XXv Vv V STIPENDIORUMv Sc.

After every word here, except at the end of a line, we fee this mark v . There is an infcription in Mountfaucon, which has a capital letter laid in an horizontal pofition, by way of interftitial mark, which makes one apt to think that this way of pointing was fometimes according to the fancy of the engraver.
P. FERRARIVS HERMES

CAECINIAE $\because$ DIGNAE CONIVGI F- KARRISSIMAE NVMERIAE $\sim \& \& c$.
Here we obferve after the words, a T laid horizontally but not after each word, which proves this to be of a much later age than the former.

Having now confidered that the prefent ufage of ftops was unknown to the ancients, we proceed to af. fign the time in which this ufeful improvement of language began.

As it appears not to have taken place while manufcripts and monumental infcriptions were the only known methods to convey knowledge, we muft conclude that it was introduced with the art of printing. The Ifth century, to which we are indebted for this invention, did not however, befow thefe appendages we call fops: whoever will be at the pains to examine the firlt printed books, will dicover no ftops of any kind ; but aibittary marks here and there, according to the humour of the printer. In the 15 th century, we obferve their firtt appearance. We find, from the books of this age, that they were notall produced at the fame time ; thofe we meet with there in ufe, being only the comma, the parenthefis, the interrogation, and the full point. To prove this, we need but look into Bale's Acts of Englith Votaries, black-leter, prinied 1550 . Indeed, in the dedication of this book, which is to Edward VI. we difcover a colon : but, as this is the only one of the kind throughout the work, it is plain this ftop was not eftablithed at this time, and fo warily put in by the printer ; or if it was, that it was not in common ufe. Thirty years after this time, in that fenfible and judicious performance of .Sir Thomas Elyot, entilled The Govirnour, imprinted

1580, we fee the colon as frequently introduced as any other ftop; but the femi-ccilon and the admiration were aill wanting, neither of thefe being vifible in this book. In Hackluyt's voyags, printed 1599, we fee the firf inflance of a femi-ccolon; and, as if tle cditors did not fully apprehend the propriety of its general admifion, it is but fparingly incroduced. 'the adnuration was the lalt ftop that was invented; and feems to have beenadded to the reft in a period not fo far diftant from our own time.

Thus we fee that thefe notes of diffinctinn came into ufc as learning was gradually advanced and im. proved; one invention indeed, but cnlarged by feveral additions.
PUNCTUM SALIENS, in anatomy, the firt rudiments, of the heart in the formation of the foctus where a throbbing motion is perceived. This is faid to be cafily obferved with a microfenpe in a brood-egg, wherein, after conception, we fee a little fpeck or cloud, in the middle whereof is a fpot thatt appears to beat or leap a confiderable time before the feetus is formed for hatching. See the article Foetus, and Anatony, p. 74 t , \&c.
Punctum fants, a phrafe by which the fchoomen vainly attempted to bring within the reach of human comprehenfion the pofitive eternity of God. Thofe fubtile reafoners feem to have difcovered that nothing, which is made up of parts whether continuous or dif. crete, can be abfolutely infinite, and that therefore eternity cannot confilt of a boundlefs ferics of fucceffive mo. ments. Yet, as if fuch a feries had always exifled and were commenfurate in duration with the fupreme Being, they compared his eternity 1.0 one of the momenis which compofe the flux of time arrefted in its courfe ; and to this eternal moment they gave the name of puncium funs, becaufe it was fuppofed to ftand fill, whilft the reft followed each other in fucceffion, all vanifhing as foon as they appeared. We need not wafte time or room in expofing the abfurdity of this conceit, as we have elfewhere endeavoured, in the belt manner that we can, to afcertain the meaning of the words eternity and infinity, and to fhow that they cannot be predicated of time or fpace, of points or moments, whether flowing or fanding ftill. (See Metaphysice, Part II. chap. 7. 8. and Part III. chap. 6.)

PUNCTURE, in furgery, any wound made by a fharp-pointed inftrument.

Puncrurf, in farriery. See there, § xl .3 .
PUNDITS, or Pendits, learned Bramins devoted to the fudy of the Shanfrit language, and to theancient fcience, laws, and religion of Hindoftan. See PhizoSорнY, n $^{\circ}$ 4-12.

PUNICA, the ponegranate tree: A genus of the monogynia order, belonging to the icofandriaclafs of plants; and in the natural method ranking under the $3^{\text {6th }}$ order, Pomace.. The caly $x$ is quinquefd fuperion ; there are five pctals; the fruit is a multilocuiar and polyfper mous apple.

Species. I. The granatum, or common pomegra. nate, rifes with a tree.ftcm; branching numeroufly all the way from the bottom, growing 18 or 20 feet high; with fpear-fhaped, narrow oppofite leaves; and the branches teiminated by moft beautiful large red flowers, fuccceded by large roundifh fruit as big as an orange, having a hard rind filled rith foft pulp and numerous. feeds. There is a variety with double \&uwers, remark:

Punifle ment Pwcell. ably beautifnl ; and one with friped flowers. 2. The his operas were admirably adapted to his words, and fo noma, or dwatf American pomegranate, rifes with a flurubby flem branching four or five feet high, with narrow fhort leaves and fmall red flowers, fucceeded by fmall fruit; begins flowering in June and continues till October.

Guthure. Both thefe fpecics are propagated by laycrs: the young branches are to be chofen for this purpofe, and autumn is the proper time for laying them. Thofe of the common fort may be trained either as half or full thandards, or as dwarts. But thofe detigned for walls mult be managed as directed for peaches.

Ufes. The dried flowers of the double-flowered pomegranate are poffelled of an aftringent quality ; for which reafon they are recommended in diathoeas, $d y$ fenteries, \&c. where aftringent medicines are proper. 'The rind of the fruit is alfo a ftrong aftringent, and as fuch is occafionally made ufe of.

PUNISEMEN'T, in law, the penalty which a perfon incurs on the commiffion of a crime. See the article Crime and Panibnent.

The ingenuity of men has been much exerted to torment each other; but the following are the punithments that have been ufually adopted in the different countries of the world. The capital punilhments have been beheading, crucifixion, burning, roalting, drowning, fcalping, hanging by the neck, the arm, or the leg, itarving, fawing, expoling ta wild beafts, rending afinder by horfes drawing oppofite ways, burying alive, thooting, blowing from the mouth of a cannon, compulfory deprivation of fleep, rolling in a barrel ftuck with mails pointed inwards, poifoning, prefling flowly to death by a weight laid on the breaft, cafting headlong from in rock, tearing ont the bowels, pulling to pieces with red-hot pincers, the raek, the wheel, impaling, fleaing alive, \&ic. \&c.

The punilhments thort of death have been, fine, pillory, imprifonment, compulfory labour at the mines, galleys, highways, or correction-houfe; whipping, ballonading, mutilation by cutting away the ears, the nofe, the tongue, the breafts of women, the foot, the hand; fqueezing the marrow from the bones with fcrews or wedges, caltration, putting out the eyes, banifhment, ruming the gauntlet, drumming, fhaving off the hair, burning on the hand or forehead, Exc.

## UNNING. Sce Pun.

PUPIL, in the civil law, a boy or girl not yet arsived at the age of puberty; i. e. the boy under 14 years, the girl under 12 .

Pupil is alfo ufed in tiniverfities, Ec. for a youth under the education or difcipline of any perfon.

Pupil, in anatomy, a little aperture in the middle of the uvea and iris of the eye, through which the rays of light pafs to the cryftalline humour, in order to be painted on the retina, and caufe vilion. See A. Natomy, P .765 , sec.

IURCELL (Henry), a juftly celebrated matter of mufic, began early to dittinguifh himfelf. As his genius was original, it wanted but little forming ; and he rofe to the height of his profeflion with more eafe than others pafs through their rndiments. He was made organit to We?tminiter abbey in the latter end of the reign of Charles II. In that of William, he fet feveral fongs for Diyden's Amybytrion and his King Artbur, which were received with jutt applaufe. His notes on
echoed to the fenfe, that the founds alone feemed capable of exciting thofe paflions which they never failed to do in conjunction. His mulie was very different from the Italian. It was entirely Englifh, and perfectly mafculine. His principal woiks have been publifhed under the title of Orpheus Britannicas. He died in 1695, in the $37^{\text {th }}$ year of his arge ; and was interred in Weltminfter abbey, where a monument is erected to his me. mory.

PURCHAS (Samuel), an Englih divine, famous for eompiling a valuable collection of voyages, was born in 1577, at Thackfed in Effer. After fudying at Cambridge, lie obtained the vicarage of Ealtwood in his native county; but leaving that cure to his brother, he fettled in London, in order to carry on the great work in which he was engaged. He publithed the firt volume in folio 1613 , and the four laft, 12 years after, under the title of Purchas bis Pil. grimage, or Revelations of the world, and the Religions objerced in all ages and places. Meanmhile he was collated to the rectory of St Martin's, Ludgate, in London, and made chaplain to Dr Abbot, archbithop of Canterbury. His Pilgrimage and the learned Hack. luyt's Voyages, led the way to all the other collections of that kind, and have been juilly valued and efteemed. But unhappily, by his publifhing, he involved himfelf in debt: however, le did not die in pifon, as fome have afferted; but at his own houfe, about the year 1628.

PURCHASE, in law, the buying or acquiring of lands, \&c. with mony, by deed or agreement, and not by defcent or right of i:heritance.

Purchase, in the fea-language, is the fame as draev in : thus, when they fay, the captain purchafes a-pace, they only mean, it draws in the cable a-pace.

PURE, fomething free from any admixture of fo. reign or heterogeneous matters.

PURFLEW, a term in heraldry, exprefing ermins, peans, or any of the furs, when they compote a bordure round a coat of arms: thus they fay, He beareth gules, a bordure, purflew, vairy; meaning, that the bordure is vairy.

PURGATION, the art of purging, fcouring, or purifying a thing, by feparating, or carrying off any impurities found therein. Thus,

In pharmacy, purgation, is the cleanfing of a medicine by retrencling its fuperduities. In chemiftry, it is ufed for the feveral preparations of metals and minerals intended to clear them of their impurities, more ufually called purification and rofining. See Refining.

In medicine, purgation is an excretory motion ariling from a quick and orderly contraction of the flefhy fibres of the fomach and inteitines, whereby the chyle, corrupted humours, and excrementslodged therein, are protruded further and further, and at length quite excluded the body by fool. See Materia Medica.

For the menflual purgation of women, fee Ivensfa
Purgation, in law, fignifies the clearing a perion's felf of a crime of which he is fufpected and accufed before a judge. This purgation is either canonical or vulFar. Canonical purgation is prefcribed by the canon* law, and the form thereof in the fpiritual court is ufually thus: The perfor fufpected takes his oath that he is innocent of the crime charged againf him; and at the

fame time brings fome of his neighb wers to make oath - that they believe he sweare truiy. V'uigar purgation was anciently by lire a water, or clie by combat, and was praatifed till abolithed by the canons. Sce Batrelin laze, Ordeal, \&ic.
luRGatIVE, or Pezang AIClicines, medicaments nhich evacuate the impurties of the body by fool, c:lled alfo cathartios.

PURGATORY, a place in which the juf, who depat out of this life, are fuppofed to expiate certain offinees whith do not merit eternal dammation. Broughton has endearoured to prove that this notion has been held ly Pagans, Jews, and Mihbomatans, as well as loy Chritians; and that in the days of the Alaceabees the Jews believed that fin might be expiated by facrifices after the de.th of the fimer, cannot be quellioned.

Much abofe has been poured upon the church of Rome for her doatrine of purgatury, and many falfe reprefentations have been made of the dostrine iticlt. The following view of it is taken from a work which is confidered as a fandard by the Britifh Catholics. I. Every fin, how flight foever, though no more than an idle word, as it is an offence to God, deferves punilhment from him, and will be punifhed by him hereafter, if not cancelled by repentance here. 2. Such fmall fins do not deferve cternal punithment. 3. Few depart this life to pure as to be totally exempt from fots of this nature, and from every kind of debt due to God's juftice. 4. Therefore few will efcape without fuffering fomething from his jultice for fuch debts as they have carried with them out of this world; according to that ule of divine juftice, by which he treats every foul hereafter according to its woiks, and according to the ftate in which he finds it in death. From thefe propofitions, which the Papif contiders as fo many felf-evident truths, he infers that there mult be fome third place of punifhment ; for, fince the infinite goodnefs of God can admit nothing into heaven which is not clean and pure from all fin both great and fmall; and his infinite jufice can permit none to receive the reward of blifs, who as yet are not out of debt, but have fomething in juftice to fuffer; there muft of neceflity be fome place or ttate, where fouls, departing this life, pardoned as to the eternal guilt or pain, yet obnoxious to fome temporal penalty, or with the guilt of fome venial faults, are purged and purified before their admittance into heaven. And this is what he is taught concerning purgatory. Which, though he knows not where it is, of what nature the pains are, or low long each toul is dethined there: yct he believes, that thofe that are in this place, being the living members of Jefus Chrift, are relieved ly the prayers of their fellow members here on earth, as allo by alms and maffes offered up to God for their fouls. And as for fuch as have no relations or friend's to pray forthem, or give alms, or procure maf. fes for their relief; they are nor neglected by the church, which makes a generai comnsmoration of all the faithful departed in every mafs, and in every one of the canonical hours of the divine office.

Such is the P. pifh doarine of purgatory, which is built chiefly upon 2 Macc. xii. 43, 4+, 45; St Math. xii. 31,32 ; and 1 Cor. iii. 15 . By Proteltants the books nf Maccabees are not acknowledged to be infipired fcriptare ; but if they were, the texts referred to would rather prove that there is no fuch place as purgatory, fince Judas did not expeet the fouls departed to VOL. XV.
reap any be:efit fom he fin- ficiser till thent...n
 this aworld:und in the world $t$ coph, bat fimely a eiter
 after the iefurration, and the renmition fiputen of is the fentence of abiolution to be pronounced on the penitent from the funt of genetal judgment. In the abfure verfe refered to in the epifite to the Corir:thians, the apolle is, hy the bat intopreters, thoupht to fecak of the dificulty with which Chiniling fincuid be fued from the dedrustion af Jerufalem. Of the flate of fouls depated he cannet well be fappefed i" fpeak, as upon difembodiad fpitits fire conla make to imprefiion. Wre cannothelp, therefore, thinkir.g with. the chusch of England, that "the Romilh doctrine of purgatory is a fond thine, vainly invented, and grounded on no warranty of foripture ;" but we mult confet's at the fame time, that it arpears to us to be a very harm!ef. error, neither hoftile to virtue nor dangerous to fociety. Sec Resureection.

PURIFICATION, in matters of religion, a coremony which confift, in cleanfing any thing from a fuppofed pollution or defilement.

The Pagans, before they facrificed, ufually batlied or wathed themfelves in water ; and they were particulariy careful to wath their hands, becaufe with thefe they were to touch the vifims confectated to the gode. It was alfo cuftomary to wath the veffel with whiclz they made their libations. The Mahometans alfo ufs purifications previous to the duty of prayer; which are alfo of two kinds, either bathing, or only wathing the face, hands, and feet. The firt is required oniry in extraordinary cafes, as after having lain with a woman, touched a dead body, \&ic. But left fo neceffary a preparation for their devotions fhould be omitted, either where water cannot be had, or when it may be of prejudice to a perfon's health, they are allowed in fuch cafes to make ufe of fine fand, or dult infead of it; and then they perform this duty by clapping their open hands on the fand, and paffing them over the parts, ia the fame mouner as if they vere dipped in water.

There were alfo many legal purifications among the Hebrews. When a woman was brought to bed of it malc child, the was efteemed impure for $+\frac{1}{}$ days ; and when of a female, for 60 : at the end of which time flie carried a lamb to the door of the temple to be offered for a burnt-otlering, and a young pigen or turtle for a lin-offering ; and by this ceremony fie wats cleanfed or purified.

PURIM, or The FEAST of Lots, a fulemn felival of the Jews, inftitured in memory of the steilietance they received, by means of Mordecai and Elther, from Haman's wicked attempt to defroy them.

PURITAN, a name formerly given in derifion to the diffenters from the church of Eingland, on account of the profeffion to follow the pure word of God, in oppofition to all traditions and humran conftitutions. It: was likewife given in the primitive church to the Novatian fchifmatics, becaufe they would never adnzit to communion any one who from dread of deatis liad apoftatized from the faith.

PURITY, the freedom of any thing from foreig! admixture.

Puritr of Siylo. See Oratary, p. 411 , Sic.
PURLIEU, fignifies all that ground near any foref, $4 Q$ which
which being made foreft by King Henry II. Richard I. and King John, was afterwards by perambulations and grants of Henry III. fevered again from the fame, and made purlieu ; that is to fay, pure and free from th.e laws of the foreft. -The word is derived from the French fur "pure," and litu" place."

PURLINS, in building, thofe picces of timber that lie accofs the rafters on the infide, to keep them from finking in the middle of their length.
By the ate of parliament for rebuilding London, it is provided, that all puriins from 15 feet 6 inches to 18 feet 6 inches long, be in their fquare 9 inches :ard 8 inches; and all in length from 18 feet 6 inches to 21 feet 6 inches, be in their fquare 12 inches and 9 inches.
PURPLE, a colour compofed of a mixture of red and blue. See Colour-Making, n? 2g. and Dying, $n^{\circ} 92$.

PURPURA, in natural hifory. See Murex: where we have given an account of the Tyrian method of dying purple with a liquid extracted from the fifh. It has been affirmed, however, that no fuch method was cver practifed. "At Tyre (fays Mr Bruce) I engaged two fifhermen, at the expence of their nets, to drag in thofe places where they faid fhell. filh might be caught, in hopes to have brought out one of the famous purple-fifh. I did not fucceed; but in this I was, I believe, as lucky as the old fifhers had ever been. The purplefifh at Tyre feems to have been culy a concealment of their knowledge of cochineal; as, had they depended upon the filh for their dye, if the whole city of Tyre applied to notling elfe but fifhing, they would not have coloured 20 yards of cloth in a ycar."

PURPURE, in heraldry. The colour fo called, which fignifies purtle, is in engraving reprefented by diagonal lines, from the left to the right. See Heralor y, p. 44 I. and Plate CCXXVII. fig. ii. $\mathrm{n}^{\circ} 6$.

It may ferve to denote an adminiftrator of juftice, a lawgiver, or a governor equal to a fovereign: and, acsording to $G$. Leigh, if it is compounded with

## PURPUREUS. See Convolvulus, n? 3.

purre, or Perkin. See Husbandry, ${ }^{\circ} 238$.
PURSER, an officer aboard a man of war, who receives her vifuals from the victualler, fees that it be well fowed, and keeps an account of what he every day delivers to the fleward. He alfo keeps a litt of the flip's company, and fets down exactly the day of cach man's admifion, in crder to regulate the quanrity of provifions to be delivered out, and that the paymafter or treafurer of the navy may iffue ont the deburfements, and pay off the men, according to his book.

PursLain, in botany.- See Portulaca.
PURVIEW, a term ufed by fome lawyers for the hody of an act of parliament, or that part which begins with "Be it enacted \&c." as contradifinguifhed from the preamble.

PURULENT, in modicine fomething mixed with, or partaking of, pus or matter,

PUS, in medicine, a white or yellowifh matter defigned by nature for the healing and comenting of wounds and fores.
The origin and formation of pus is as much unknown as that of any other animul fuid. In an inaugural differtation publifhed at Edinburgh by Dr Hends, the author fuppofes pus to be a fecreted fluid. It has been thought by many, that pus is either a fediment from ferum when beginning to putrefy, or that it is the fame fluid inpillited by the heat of the body. But both thele opinions are refuted by fome experiments of our author, which thow, that pus is much lefs inclined to putrefaction than ferum, and the putrefaction of both is haftened by an addition of fome of the red part of the blond. Some other experiments were made in order to try whether pus could be artificially produced. A thin piece of lamb's fleth, applied to an ulcer difcharging laudable pus, and covered over with lead, did not allume the appearance of pus, but became fetid, and was much leffened. Serum, in its inflammatory and in its ordinary fate, and lymph in different ftates, were applied to the fame ulcer, which ftill difcharged good pus; but none of there were converted intu pus; on the contrary, they became very putrid.

In oppofition to thefe arguments of our author, however, it may be alleged, that if pus was a fecreted fluid, the veffels by which it was fecreted would certainly be vifible; but no fuch thing has ever been obferved: on the contrary, it is certain that pus cannot be formed unlefs the air is excluded from the wound. Thefe difputes, howevcr, are of no great confequence: but in fome cales it becomes a matter of real importance to diftinguilh pus from mucus; as thus we may be enabled to know whether a cough is confumptive, or merely catarrhous. See Mucus. Mr Home, in a differtation on the properties of pus, in which he avails himfelf of the experiments of Mr Hunter, as delivered in his Phyfiological Leftures, fays, "that the characteriftic of pus is its being compofed of globules; and he thinks that the prefence of globules feems to depend upon the pus being in a perfect ftate. It differs from the blood in the colour of the globules; in their not being foluble in water, which thofe of the blood are; and from the fluid in which they fwim being coagulable by a folution of fal ammoniac, which ferum is not." Refpecting the formation of pus, our author adopts the idea fuggefled by Mr Hunter, that the veffels of the part aifume the nature of a gland, and fecrete a fuid which becomes pus. Mr Home afcertains, by experiment, that pus, at its formation, is not globular, but a tranfparent fluid, of a confiftence, in fome fort, refembling jelly ; and that the globules are formed while lying upon the furface of the fore; requiring, in fome inflances, while the influence of the external air is excluded, fifteen minutes for that purpofe.

PUSTULE, a pimple, or fmall eruption on the fkin full of pus; fuch as the eruptions of the fmall-pox.

PUTAMINER, (from putamen " a fhell,") the name of the 25 th order of Limmus's fragments of a natural method; conlifting of a few genera of plants. allied in habit, whofe tlelhy feed-veffels or fruit is frequently covered with a hard woody thell. See BotaNY, p. 462.

PUTEOLI, (Livy, Strabo) : a town of Campania;

## P U T

fo called either from its wells, there being many hot and cold fprings thereabouts; or from its fench, putor, caufed by fulphureous exhalations, (Varro, Serabo). It is now called $P_{u}$ azuoli, and is plestantly and advantageoufy fituated for trade. In a very remote age, the Cumeans made it their arfenal and dockyard; and to this naval eitablifhment gave the fublime appellation of Dicearchia or Fu/l Poruer.
The Romans were well aware of the utility of this port and took great pains to improve its matural advantages. Nothing remains of their works but a line of piers, buile to break the force of a roiling fea : they are vulgarly called the bridge of Caligula, becaufe thet madman is faid to have marched in triumph from Puzzuuli to Baia on a bridge ; but his was a bridge of boats.

The ruins of its ancient eelifices are widely fpread along the adjacent hills and fhores. An amphitheatre ftill exilts entire in moft of its parts, and the temple of Serapis offers many curious fubjects of obfervation; half of its buildings are Aill buried under the earth thrown upon it by volcanical commotions, or aecumulated by the crumblings of the hill; the inclofire is fquare, environed with ouildings for priefts and baths for votaries ; in the ce: tre remains a circular platform, with four Alights of feps up to it, vafes for fire, a centricul altar, rings for vistims, and other appendages of facrifice, entire and not $d: f_{i}$ laced ; but the columns that held its roof have been removed to the new palace of Caferta (iee Caserta). Behind this round place of workhip itand three pillars without capitails, part of the pronaos of a large temple; they are of cipolline marble, and at the midule of their height are fuil of holes eaten in them by the file-fill ${ }^{*}$.

The prefent city contains near 10,000 inhabitants, and occupies a fmall peninfula ; the cathedral was a pagan temple, dedicated to the divinities that prefidad over commerce and navigation. E. Long. it. 4o. N. Lat. 41.15.

In the neighbourhood of Puteoli are many relicks of ant:ent grandeur, of which none deferves more attention than the Campanian way paved with lav:a, and lined on cacla fide with venerable towers, the repofitories of the cead, which are richly adorned with fucco in the infide. This road was made in a mof folid expenfive manner by order of Domitian, and is frequently the fubject of cncomium in the poems of Statius.

PUTI caraja, in botany, is a genus of Indian plants, of which the charaters, as given by Sir Wulliam jones in the Aliatic Refearches, vol. ii. p. 35 I . are thefe. The calyx is five eleft, the corolla has five equal petals, the pericarpium a thorny legumen and two feeds, the leaves oval and pinnated, and the fem armed. - The feeds (fays the learned Prelident) are very bittcr, and perhaps tonic ; fince one of them, bruifed and given in two dozes, will, as the Hindoos alfert, cure an intermittent fever."

Putorius, in zoology. See Mustela.
PUTREFACIION, one of the natural procefles, dircaty cppofite to the life of animals and vegetables, by which organized bodies are diffolved, and reduced to what may be called their original clements.
Putrefation d.fers from chemical folution; hecaufe, in the latter, the diffolved bodies ase kept in their flate of tolution by being combined with a certain agent from which they cannot eafily be feparated ; but in pu-
trefation, the agent winich difflwes the body apperis l'uta:... not to combinc rith it in any manecr of way, but merely tion. to feparate the pirts from cach other.-It diEf:s alo from the refolution of bodies by dilillation with viole:t fire ; becaure, in difillation new and permanent core. pounds are formed, but by putrefaction every thir,; feem; to be refulved into fubfances much more limplis and indeftruati,ne than thofe which are the refult of ary $f$ chemical procefs.
The bodies mof liable to putrcfation are thr fe of animsls and vegetables, efpecially when full of juies. Stones, though by the action of the weather they with moulder into duft, yet feem not to be fubject to any thing like a real putrefadion, as they are not zefolved into any other fubtances than fand, or fmall duft, which fill preferves its lapideons nature. In like manner, regetables of any kind, when deprived of their juices by drying, may be peferved for many ages without being fubjected to any thing like a purrefactive procefs. The fame holds gnod with refpee to animals; the parts of which, by fimple drying, may be preferved in a found fate for a much longer time than they could be without the previous exhalation of their juices.
Putrcfaction is generally allowed to be a kind of fermentation, or rather to be the laft itage of that procefs; which, beginning with the vinous fermentation, gocs on through the acetous, to the flage of putridity, where it fops. It is argued, however, and feemingly not without a great deal of reafon, that if putrefaction is a fermentation, it mult neceffarily be a kind diftind fom either the vinous or acetous; iince we frequently obferve that it takes place where nether the vinous nor the acetous ftages have gone before ; of confequence, it mult be, in fome cafes at leaf, entirely independent of and unemnetted with them. In feveral other refoects it differs fo much from thefe proceffes, that it feems in fome degree doubtful whether it can with propriety be called: ar fermenation or not. Both the vinous and acetous fermentations are attended with a conliderable degree of heat : but in the putrefaction of animal matters efpecially, the heat is for the moft part fo fmall, that we cannot be certain whether there is any degree of it or not produced by the procefs. In cafes, indeed, where the quantity of corrupting animal natter is very great, fome heat may be perceived: and accordingly Dr Monro tells us, that he was fenfible of heat on thanting his hand into the felly of a dead and corruping whale. But the moft remarkable difference between the putrefactive fermentation and that of the vinous andiaccions kinds is, that the end of buth the erecefles is to produce a new and permanent compound ; but that of the putrefartive procets is not to produce any new form, but to deltroj, and reio've one which already exith into the original principles from which all things fem to proceed. Thus, the vinous fermentation produces ardent fpirits; the acetons, vinegar : but putrefaction produces nothing but earth, and fome effuvia, which, though mof dilagreeable, and even poilonous to the human body, yet, being imbibed by the eath and recetable craition, give life to a new race of binges. It is commonly fuppoled, inseed, that volatile alkdi is a prodnation of the putrefative procefs; but this feems liable to difpute. The vapour of pu:e volatile alk:li is not hurthul to the human frame, but that of putrefying fubtances is exceedingly fo ; and, excepting in the cale of mine, the

Entrefic. 1i:oz.
geacration of volatile athali in putrid fubtances is very equivocal. This fubfance, which produces nore alkali thatm any other, is much lefs offenfive by its putrid fetor than others and all animal fubftances produce a volatile athalion being expofed to the action of fire, of quicklime, or of alkaline falts. In thefe cafes the volatile allali is not fuppofed to be produced by the quicklime or fised filt, but only to be exticated from a kind of ammoniacal falt pre-exifting in the animal matters; the probabilicy is the feme in the other cafe, viz. that volatile aikali is not produced, but only extricated, from the ef fublennees by putrefation.

The only thing in which the putrefactive fermentation agrees with the other kinds is, that in all the three there is an extrication of fixed air. In the putrefactive procefs, it has been thought that this cicape of the fixed air deprives the body of its cohefion: and Dr Macbride has written a treatife, in which he endeavonts to prove, that fixed air is the very power of cohetion itfelf, and that all bodies when deprived of their fixed air entirely lofe their culefon. faccording to this hypothefis, the caule of putrefaction is the efrape of fixed air: but it is impofible to give a reato why fixed air after having ii) long remained in a body, and preferved its colefion, thould of a fudden begin ts fly off without being atted upon by fomething elfe. To a fimilar objeftion the hypothelis of thofe is liable, who fuppofe putrefaction to be cocafioned by the efcape of phlogifon ; for phiogifon is now known to be a chimera: and though it were a reality, it would not fy off without fomething to carry it off, any niore than fixed air. Animalcules have been thought to be the caufe of putrefation: but if animal fubftances are covered fo as to exclude the accefs of flies or other inleets, no fuch animalcules are to be difoovered though putrefiction has taken place; and indeed it requires little proof to convince us, that animands are produced in corrupted bodies only becaufe fuch fubtances prove a proper nidus for the egrss of the pasent irfects.

To underltand the truc caufe of putrefaction, we mult take notice of the circumflances in which the procels goes on molt rapidly. Thefe are, heat, a little moiture, and confined air. Extremecold prevents putrefacion, as well as perfect drynefs; and a free circudation of air carries off the putrid efluvia; a ftagnation of which feems to be neceffary for carrying on the proeef. It feems alfo to hold pretty generally, that putiefying bodies fwell and become fpecificully lighter; for whelt reafon the carcafes of dead amimals, after laving funk in water, sile to the top and Hoat. This S.at phenomenon, as has been obferved under the article Bloon, no 2g. thows that thee bodies have received a certain qumtity of an elafic principle from the air, rafih thus fwells then up to fuch a fize. It may be faid indeed, that this increafe of fize in putrefying bodies is owing only to the extrication of air within them-- lves: but this amouns to the fame thing ; for the air wheh exifts intemally in the body of any animal, is contirely divefted of elafticity white it remains there, -n 3 only fhows its elaftic properties upon beiner extriatted. The elatic principle which combines with the ary fixed in the anmal fubt ince, therefore, mufteme from the exernal atmofphere; and confequelty the agent in putrefaction muft be the claftic principle of the ..tne fore ineif pobthy the fame with clementary fire.

But, granting this to be true, it is difficult to fhow $l^{\prime}$ why putrefaction fhould not take place in a living body as well as in a dead one; feeing the one is as much expofed to the action of the air as the other. This difficulty, however, is not peculiar to the prefent hypothefis; but will equally occur whatever we may fuppofe the caufe of putrefaction to be. The difficulty feems to be a little cleared up by Dr Prieftley, who fhows, that, by means of refpiration, the body is freed from many noxious efllusia which would undoubtedly deftroy it; and by the retention of which, he thinks, a living body would putrefy as toon as a dead one. The way in wtich refpiration prevents the putrefaction of the body, is evidently the fame with that in which the wind prevents fifhor flefh lung up in it from becoming putrid. The conftant infiration of the air is like a theam of that element coutinnally bluwn upon the body, and that not only upon its furface, but into it ; by which? means putrefaction is prevented in thofe parts that are molt lisble to become putrid. On the other hand, the elaftic pinciple received from the air by the blood *, by invigurating the powers of life, quickening the cir- $a^{\circ}$ culation, and increafing perfpiration, enables the body to expel noxious particles from other parts of the body which cammot conveniently be expelled by the lungs.

This leads us to confider the reafon why a free expofure to the air prevents the coming on of putrefac. tion, or why the confining of the putrid effluvia fhould be fo necellary in this procefs. Here it will be proper to recollect, that putrefaction is a fimple refolution of the body into earth, air, \&cc. of which it feems originally to have been compofed. This refolution is evidently performed by an expanfive power feemingly fituated in every particle of the body. In confequence of this priaciple, the body firft fwells, then burfts, flies off in vapour, and its particles fall afunder from each other. The action of the putrefactive procefs, then, is analogous to that of fire, fince thefe are the very properties of fire, and the very effects which follow the action of fire upon any combuttible body. It is therefore exceedingly probable, that the agent in the air, which we lave all along confidered as the caufe of putrefaction, is no other than fire itfelf; that is, the ethereal fluid expanding itfelf every where, as from a centre to a circumference. The force of the fluid, indeed, is much lefs in putrefac. tion than in actual ignition ; and therefore the effects alfo take place in a much fmaller degree, and require : much longer time : neverthelefs, the fame circumftances that are neceffary for keeping up the action of fire, are alfo neceflary for keeping up the putrefactive procets. One of thefe is a free accefs of air, yet without too violent a blaft ; for as fire cannot burn without air, neither can it endure too much of it: thas a candle goes out if put under a receiver, and the air exhanfted; and it will do the fame if we bluw viclently uponit. In like manner, purefaction sequires a certain quantity of air, much leís indeed than fire: and as it iequires lefs to fupport it, fo it can alfo endure much lefs air than fire ; for a fream of air which would not put out a fire, will effectually prevent putrefaction. The caufe of this in both is the fame. Fire cannot burn becatife the vapour is carried off too faif ; and thus the latent heat, which ought to fupport the flame $f$, is entirely difipated." In like manner putrefaction is as certainly attended with

## P U 'r

imprifoned in the black-lole at Calcuthe, after paritg a night in that difmal halitation, he found himjelf in a high putid fever. When failors in long voyages are ohliged to feed upon putrid aliments; when, than' ftormy weather, hey are much expofed to wet; in the one cafe the putrefoent calluvia being kept from fly ing off, and in the ohler a greater quantity being throw on into the body than what it naturally contains, the fonrvy, madignant fevers, \&c. make their apearance (1) Neither can thefe difeafes be removed without ret:oving evcry one of the caufes jult now mentioned : for as putrid difeafes will be the confequence of contined air, maftinefs, \&c. though the provifions be ever fo grod; fo, on the other hand, if the provifions be bat, the bett air, and moft exact cleanlinets, nay, the beft medicines in the world, will be of no fervice; as hath been often obferved in the feurvy.

From this account of the nature, caufe, and method of preventing putrefaction by means of a current of air, we may cafly fee the reafin why it does not, take place in fome other cafts allo. Bodies will not putrefy in कucuo, becaufe there the atmofple:e has mut accefs to impart its clatlic principle; and though in the vacuum itfelf the principle we fpeak of does undoubtedly exif, yet its action there is by far too weat to decompofe the fruciure of an animal body. In extreme cold, the reafon why putrefaction does not tale place has been already fhown. If the heat is extrenicly great, the procefs of ignition or burning talies place inltead of putrefaction. If the body is very dry, putrefaction cannot take place, becaufe the texture is too firm to be decompofed by the weak action of the elatlic principle. Putrefaction may alfo be prevented by the addition of certain fubfances; brit they are all of them fuch as either harden the texture of the body, and thus render it proof againft the action of the ela. Itic fluid, or, by dillolving its texture entirely, bring it into a fate fimilar to what it would be brought
(A) This aeriform fluid, which is exhaled from animal bodies in a flate of putrefaction, acts at certain times more powerfully than at others, and is indecd in one flage of the procefs infinitely more noxious than any other elaftic fluid yet difeovered. In the Geutleman's Magazine for Auguft 1788, Dr St John, informs us, that he knew a Gentleman who, by flizhtly touching the inteftines of a human body beginning to liberate this corrofive gas, was affected with a violent inflammation, which in a very fhort face of time extended up almoft the entire length of his arm, producing an extenfive ulcer of the molt foul and frightful appearance, which continued for feveral months, and reduced him to a miferable llate of cmaciation. The fame trriter mentions a cclebrated profefior who was attacked with a violent inflanmation of the nerves and fance: from which he with difficulty recovered, merely by fooping for an inftant over a body which wis begiming to give forth this deleterious fluid. Hence he infers, that the fame gas molified or mixed, or united with others, may be the eccafion of the plague, which has fo often threatened to annihilate the human feccies. It is happy, however, for mankind that this particular flage of putrefaction continues but for a lew hours; and, what may appcar very remarkable, this deftructive gas is not very difagreeable in fmell, and has nothing of that abomirable and loathfome fetor produced by dead bodies in a lefs dangeruns ftate of corruption ; but has a certain fmell totally peculiar to itfelf, by which it may be infantly difoovered by any one that ever fimelled it beforc. This is an object very worthy the attention of phyficians: it is both extremely intcrefing, and very litto known ; but at the fame time it is a ftudy in the higheft degree unpleafant, from the deteftable fimell and na. tlincfs which attend the putrefaction of animal bodies; and a man mult be amed with uncommon philanthropy and refolution to attempt it.

Dr St John thinks it probable that there is a rapidfixation of the bafis of vital air in dead bodies at a certain fate of putrefagion on account of the luminous appearance which they fometimes mathe, and which cxits but for a few hours: but whether this luminous appearance takes place in every hody, or rihether it precedes or follows the exhalations of the cor:ofive gas abovementioned, he had not, when he whot his fapsr, been able to difcover.

## P U T

Pureface by the nimot porrer of putrefaction, fo that the protion, cefs camot then take place. Thus various linds of filts and acids harden the texture of animal fubitances, and thas ate fuccefsfully ufed as antifeptics. The fame thing may be faid of ardent fpirits; while oils and gums of varions kinds prove antifeptic by a total exclution of air, which is necellary in fome degree for carrying on the procefs of putrefaction. Many vegetables, by the altringent qualites they poffefs, harden the texture of anmal fublances, and thus prove powerfully antifeptic; while, on the other hand, fixad alkaline falts, quicklime, and caullic volatile alkali, though they prevent putrefaction, yet they do it by diffolving the fubfances in fuch a manner that putrefaction could do no more though it had exerted its utmoft force. There is only one other antifeptic fubftance whofe effects deferve to be confidered, and that is fugar. 'This, tho' neither acid nor allaline, is yet one of the molt effectual means of preventing putrefaction: and this feems to be owing to its great teadency to run into the vinous fermentation, which is totally inconfifent with that of putrefation; and this tendency is lo great, that it can fearce be counteracted by the tendency of animal fubftances to putrffy in any circumftances whatever.

Some kinds of air are remarkably antifeptic, though this fubject has not been fo fully inquired into as could be wifhed. The molt powerful of them in this refpett is the nituous air; next to it, is fixed air; but the powers of the other airs are not fo well known. It is probable that the antifeptic properties of fixed and nitrous air, are owing to their quality of extinguifhing fire, or at leat that the principle is the fame; but, till the nature of thefe two kinds of air are better known, little can be faid with certainty on the fubject.

Sir Join Pringle has made experiments to determine lite powers of certain fubltances to promote or to pre. vent putrefation. From thefe experiments he has fomed the following Table, thowing the relative antiteptic powers of the faline fubltances mentioned. Having found that two drams of beef put in a phial with two ounces of water, and placed in a heat equal to $90^{\circ}$ of Fahrenheit's thermometer, became putrid in 14 hours, and that 60 grains of fea-falt preferved a fimilar mixture of beef and water more than 30 hours, he made the antifeptic power of the fea-filt a ftandard, to which he compared the powers of the other falts. The algebraic character + fignifies, that the fublance to which it is annexed had an seater antifeptic power than is expreffed by the numbers:

| Sea-falt, or the ftundard | - |  |  | - | 1 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Sil.gem | - |  |  |  | ${ }^{1}+$ |
| Vitriolated tartar | - |  | - |  | 2 |
| Spiritus Mindereri | - |  |  |  | 2 |
| Soluble tartar |  |  |  |  | 2 |
| Sal diureticas | - |  |  |  | $2+$ |
| Crude Sal ammoniac | - |  | - |  | 3 |
| Saline nisture | - |  |  | - | 3 |
| Nitre |  |  |  | - | $4+$ |
| sislt of harthorn | - |  | - |  | $4+$ |
| Salt of wormwood | - |  | - |  | $4+$ |
| liorax | - |  | - |  | 12 |
| Salt of amber |  | - |  | - | 20 |
| Alum | - |  |  | - | 30 |

$N$. $B$. The quantitics of firitus Mindereri and of
the faline misture were fuch, that each of then: contained as much alkaline falt as the other neutral falts.

Myrrh, alocs, afafœtida, and terra Japonica, were found to have an antifeptic power 30 times greater than the ftandard. Gum ammoniacum and fagapenum thowed little antileptic power.

Of all refinous fubtances, camphor was found to refilt putrefaction molt powerfully, Sir John Pringle believes that its antifeptic power is 300 times greater than that of fea-falt.

Chamomile flowers, Virginian fnake-root, pepper, ginger, faffron, contrayerva root, and galls, were found to be 12 times more antifeptic than fea-falt.

Infuri: ns of large quantities of mint, angeliza, ground ivy, green tea, red-roles, common wormwood, muttard, and horfe-radifh, and alfo decoctions of poppy-heads, were more antifeptic than fea-falt.

Decoctions of wheat, barley, and other farinaceous grains, checked the putrefaction by becoming four.

Chalk, and other abforbent powders, accelerated the putrefaction, and refolved meat into a perfect mucus. The fame powders prevented an infufion of farinaceous grains from becoming mucilaginous and four.

One dram of fea-falt was found to preferve two drams of freth beef in two ounces of water, above 30 hours, uncorrupted, in a heat equal to that of the human body, or above 20 hours longer than meat is preferved in water without falt: but half a dram of falt did not preferve it more than two lours longer than pure water. Twenty-five grains of falt had little or no antifeptic quality. Twenty grains, 15 grains, but efpecially 10 grains only of fea-falt, were found to accelerate and heighten the putrefaction of two drams of fleth.Thefe fmall quantities of fea-falt did alfo foften the flefh more than pure water.

The fame learned and ingenious phyfician made experiments to difcover the effects of mixing vergetable with animal matters.

Two drams of raw beef, as much bread, and an ounce of water, being beat to the confittence of pap, and expofed to $90^{\circ}$ of heat according to Fahrenheit's thermometer began to ferment in a few hours, and continued in fermentation during two days. When it hegan to ferment and fwell, the putrefaction had begun ; and in a few hours afterwards, the fmell was offenfive. Next day the putrid fmell ceafed, and an acid tafte and fmell fucceeded. Flefh alimentary vegetables as fpinach, afparagıs, fcurvy-grafs, produced fimilar effects as bread on fleíh, but in a weaker degree. From feveral other experiments he found, that animal fubfances excite the fermentation of vegetable fubftances, and that the latter fubftances correct the putrefency of the former.

By adding faliva to a fimilar mixture of flefh, bread, and water, the fermentation was retarded, moderated, but rendered of twice the ufual duration, and the acid produced at laft was weaker than when no faliva was ufed.

By adding an oily fubflance to the common mixture of fefh, bread, and water, a ftronger fermentation was produced, which could not be moderated by the quantity of faliva ufed in the former experiment, till fome fixed alkaline falt was added; which falt was found, without filivi, to ftop fuddenly very high fermentations. He did not find that fmall quantities of the following
efac- falts, fal anmoniac, nitre, vitriolated tartar, fal diureticus, falt of harthorn, falt of wormwood, were feptic, as fmall quantities of fea-falt were.

Sugar was found to refilt putrefaction at firn, as other falts do, and alfo to check the putrefaction atter it had begun by its own fermentative quality, like bread, and other fermentative vegetabies.

Lime-water made fone fmall refiltance to putrefaction.

Port-wine, fmall-becr, infufions of bitter vegetables, of bark, and the juice of antilcorbutic plants, retarded the fermentation of mixtures of felh and bread. But an unftr.ined decoction of bark confiderably increafed that fermentation.

Crabs eycs accelerated and increafed the fermentation of a mixture of flelh and bread.

Lime-water neither retarded nor haftened the fermentation of fuch a mixture : but when the fermentation ceafed, the liquor was neither putrid nor acd, but imelt agreeably.

Flefh pounded in a mortar was found to ferment fooner than that which had not been bruiled.

The tough inflammatory crult of blood was found to be moll putrefcent ; next to which the craffamentum, or red coagulated mafs; and laftly the ferum.

Dr Macbride's experiments confirm many of thofe above related, efpecially thofe which thow that the fermentation of vegetable fubtances is increafed by a mixture of animal or putrefcent matter; that the putrefcency of the latter is corrected by the fermentative quality of the former ; and that the putrefaction and fermentation of mixtures of animal and vegetable fubflances were accelerated byadditions of abforbent earths and of Peruvian bark. He alfo found, that although unburnt calcareous earths were feptic, quicklime and lime-water prevented putrefaction, but that they dcftroyed or diffolved the texture of flefh.

The expesiments of the author of the Effai pour firvir à l'Hifoire de la Putrefarion, fhow that metallic falts, refinous powders, extracts of bark, and opium, are very powerfully antifeptic, and that falts with earthy bafes are lefs antifeptic than any other falts.

PUTTOCK-Shrouds. See Putlock-Shrouds.
PUTTY, in its popular fenfe, is a kind of pate compounded of whiting and lintfeed oil, beaten together to the confiftence of a thick dough.

It is ufed by glaziers for the faftening in the fquares of glafs in fanh-windows, and by painters for fopping up the crevices and clefts in timber and wainfcots, \&c.

Putty fometimes alfo denotes the powder of calcined tin, ufed in polifhing and giving the laft glofs to works of iron and fteel.

Terra puzzulana, or Pozzolana, is a greyifh kind of earth ufed in Italy for building under water. The beft is found about Puteoli, Baies, and Cumx, in the kingdom of Naples, from the firt of which places it derives its name. It is a volcanic product, crmpofed of heterogeneous fub?tances, thrown out from the burning mouths of volcanoes in the form of a hes; fometimes in fuch large quantities, and with fo great violence, that whole provinces have been covered with it at a confiderable diftance. In the year 79 of the common era, the cities of Herculaneum, Pompeia, and Stabia, although at the diftance of many miles from Vefuvius, were, neverthelcfs, buried under
the matters of thefe dreadful eruptions; as Rergman Puzzatisid relates in his Treatife of the Volcanic Produds. "This volcanic carth is of a grey, brown, or blackill colour ; Pycnallyleof a loofe, granular, or dully and rough, porous or fpongy texture, refembling a clay lardened by fire, and then reduced to a grots powder. It contains various heterogeneous fubftances mixed with it. Its fpecific gravity is from 2500 to 2800 ; and it is, in fome degree, magnetic: it farcely cffervefces with acids, though partially foluble in them. Ir earily melts per fe; but its moft diftinguilhed property is, that is hadens very fuddenly when mixed with $\frac{-3}{3}$ of its weighe of lime and water; and forms a cement, which is nore durable in water than any other.
According to Bergman's Analyfis, 100 parts of it contain from 55 to 60 of filiceous earth, 20 of argillaceous, five or fix of calcareous, and from 15 to 20 of iron. Its efferts, however, in cement may perhaps depend only on the iron which has been reduced into a particular fubtance by means of fubterrancous fires; evident figns of which are obtervable in the places where it is obtained. If the flate in Henneherg, or Kennekulle in the province of Wettergotland, ihnuld happen to get fire, cire uppermolt fratum, which now confitts of a mixture of iron and different kinds of rocks, called graberg in the account given of them, they might perhaps be clanged partly into flag and partly into terra puzzolana.

It is evidently a martial argillaceous marl, that has fuffered a moderate heat. Its hardening power arifes from the dry tate of the half-baked argillaceous particles, which makes them imbibe water very rapidly, and thus accelerates the deficcation of the calcareous part; and alfo from the quantity and femiphlogiticated fate of the iron contained in it. It is found not only in Italy but in France, in the provinces of Auvergne and Limoges; and alfo in England and elfewhere.

PUZZUOLI. Sce Putiol.
PYANEPSIA, in antiquity, an Athenian feftival celebrated on the feventh day of the month Pyanepfron; which according to the generality of critics, was the fame with our September.

Plutarch refers the inflitution of this feaf to Thefeuc, who, after the funeral of his father, on this diy paid his vows to Apollo, becaufe the youths who returned with him fafe from Crete then made their entry into the city. On this occafion, thefe young men putting all that was left of their provifions into one kettle, featted together on it, and made great rejoicing. Hence was derived the cuffom of boiling pulfe on this feftival. The Athenians likewife carried about an olive branch, bound about with wool, and crowned with :lll forts of firt-fruits, to fignify that fearcity and barrennefs were ceafed, finging in proceflion a fong. And when the folemnity was over, it was ufual to crect the olive-branch before their doors, as a prefervative againft fcarcity and want.

PYCNOSTYLE, in the ancient architecture, is a building where the columas itand very chere to each other; only one diameter and a half of the column being allowed for the intercolumniations.

According to Mr Evelyn, the pycnoflyle chiefly belonged to the compofite order, and was ufed in the moot magnificent buildings; as at preient in the perifyle at St Peter's at Rome, which confifts of near 300 co-
lumns:

PYKE, a watchman in India, employed as a guard at night. Likewife a footman or runuer on bufmefs. 'llocy are sencrally arned with a fpear.

PYLADES, a fon of Strophius, king of Phocis, by one of the fifters of Agamemnon. He was educated together with his coulm Oreftes, with'whom he fomed the moft inviolable friendthip, and whom he atifled to revenge the murder of Agamemnon, by af: fallinating Clytemneftra and Egyfthus. He alfo accompanied him in Tausica Cherfonefus; and for his fervices Oreftes rewarded him, by giving him his filter Mlectar in marriage. Pylades had by her two fons, viston and Strophius. The friendhip of Oreltes and Pylades became proverbial.

PYLORUS, in anstomy, the under orifice of the fomach. Sec Anatomy, $n^{\circ} 91$.

PYLUS (anc. geog.), a town of Elis; its ruins to be feen on the road from Olympia to Elis, (Paufanias) ; fituated between the mouths of the Peneus and Sellees, near Mount Scollis, (Strabo.) Built by Pylas of Mesara, and deftrnyed by Hercules, (Paufanias.) - Another Pylus in Triphylia, (Strabo); by which the Alpheus runs, (Paufinios); on the confines of Arcadia, and not in Arcadia itfelf, (id.)-A third in Meffenia, (Strabo, Ptolemy) ; fituated at the Cont of Mount A.galeus on the feacoat, over tgainft the illand Sphayea or Sphacteria: built by Pylas, and fettled by a colnny of Leleges from Megaris; but thence expelled by Neleus and the Pelafyi, and therefore called Nclea, (Homer.) A findy territory. The royal refidence of Neleus, and of Neftor his fon: the more ancient and more excellent Pylus; whence the proverb Pylus ante Pylun, (Arifophanes, Plutarch), ufed when we want to teprefs the arrogance and pride of any one: faid to be afterwards called Coryphoffium. It made a figure in the Pe?oponnefian war; for being rebuilt by the Athenians, it proved of great beacfit to them for the fpace of 15
years, and of much annoyance to the Laccierronians, I'y: ("hucydides). All the three $P$ y 1 wcie iubjue to Neftor, (Strabo.)

PYRAMID, in geometry, a folid fanding on a triangular, tquare, or polygonal bafis, and terminating in a point at the top; or, according to Eucid, it is a folid figure, confilting of feveral triangles, whore bales ate all in the fame plane, and have ore common vertex.

Pyranids are fonctimes wed to preferve the memory of Engular events, and fometimes to tranfmit to pofterity the glory and magnificence of princes. But as they are effecmed a fyabol of immortality they are molt commonly ukd as funcal monsments and temples to the gods. Such is that of Cellius at Rome; the pyramids of Dathur drawn by Pocock ; and thore other celcbrated ones of Egypt, as famous for the enormity of their fize as their intiquity. Of thefe the latgeft are the pyramids of Geiza, fo called from a village of that name on the bar:ks of the Nile, ditant from them about II miles. The three which molt attract the attention of travellers ftand near one another on the weft fide of the river, almoft opoofite to Grand Cairo, and not far from the place where the ancient Memphis food. They were vilited by M. Savary, of whole defcription of them we thall here give an abftract.

He took his journey in the night-time, in order to get up to the top of the great one by tunrife. Having $\mathrm{g} 口 \mathrm{t}$ within light of the two great ones, while the full moon fhone upun them, he informs us, that they ap--peared, at the ditance of three leagues, like two points of rock crowned by the clouds.

It is in the rich territory which furrounds them that fable has placed the Elyfian fields. The canals which intertect them are the Styx and Lethe.
"The afpects of the pyramids raried according to the circuits he made in the p'ain, and the pofition of the clouds difplayed themfelves more and more to view. At hall palt three in the morning we arrived (fays he) at the foot of the greateit. We left our cloathes at the gate of the palfage which leads to the infide, and de. fcended, carrying each of us a flambean in his hand. Towards the brittom you muft creep like ferpents to get into the interior paffage, which correfponds with the former. We mounted it on our knees, fupporting ourfelves with our hands againlt the fides. Without this precaution one runs the rifk of flipping on the inclined plane, where the flight notches are infuficient to ftop the foot, and one might fall to the bottom. Towards the middie we fired a pifnl, the frightful noife of which, repeated in the cavities of this immenfe edifice, continued a long time, and awakened thoufands of bats, which flying round us, Aruck againft our l:ands and faces, and extinguifhed feveral of our wax candles. They are much larger than the European bats. Arrived above, we cntered a great hall, the gate of which is very low. It is an oblong fquare, whelly compofed of granite. Seven enormous ftones extend from one wall to the other, and form the roof. A farcophagus made of a fingle block of marble lies at one end of it. It is empty; and the lid of it has been wrenched off. Sone pieces of earthen vafes lie around it. Under this beautiful hall is a chamber not fo large, where you find the entrince to a conduit filled with rubbifh. After examining the fe cavis, where diylight never penetrated, we delcended the fame way, taking care not to fall in.

## 1 Y R [ 68i 〕 1 Y R

to a well, which is on the left, amd goes to the wary ing to Pwooke, they are from four fect and a lalf to. Pramids. foniddtions of the pyranid. Pliny nakes mention of forar feet hiegh, being not fo high at the top as at the this well, and fays it is 26 cubits dicep. The internal air of this edifife never being renewed, is to hot and meplistic that one is almonf fuffocated. When we canse out of it, we were dropping with fwent, and pale as death. Afier refrefhing ourfelves with the external air, we lof tuo time in arcending the pyramid. It is compofed of more thin 200 lay ers of itone. They ovcrlap each other in proportien to their clevation, which is from two to four feect. It is neceifiry to climb up all the:e enormous teps to reach the top. We urdertook it at the not th-eaft angle, which is the leaft damaged. It took us, however, half an hour with great pains and many efforts to effer it.
" The fiun was rifing, and we enjoyed a pure air, wilh a moft delicious coolnefs. After almiring the profpect around us, and engraving our names on the fium init of the pyramid, we defeended cautiounf, for we had the albyfs before us. A picce of fone detacling itfelf under our feet or h.ands might have fent us to the bottom.
" Arrived at the foot of the pyramila, we made the tour of it, contemplating it with a fort of horror. When viewed clofe, it feems to be made of malles of rocks; but at a hundred paces diftance, the largenefs of the fones is lolt in the immenfity of the whole, and they appear very fmall.
"To determine its dimenfions is fill a problem. From the time of Herodetus to our days it has been meafured by a great number of travellers and learned men, and their different calculations, far from clearing up doubts, have only increafed the uncertainty. The ful. lowing table will ferve at laft to prove how difficult it is to come at the truth.

Hoight of the great Pyramid.

Number of liyyers of Stone which form it.

"It appears that Meffes Greaves and Niebuhr have prodigioutly ceceived themfelves in meafuring the perpendicular height of the great pyranid. All the itavellers allow that it has at leaft 200 layers of tlone. Thefe layers are from two to four feet high. AccordVos. XV.
bafe. Profper Alpiaius informs us, that the elevation of the firft layer is five feet, but it diminifles infenlibly in proportion as one mounts. Thevenot mentions zo iteps of large fones, the thichnefs of which makes the height of them about two feet and a half one with another: ife mealured fome of them more than three feet high. 1 have meafured feveral of them which were more than three feet high, and I found none lefs than two ; the leaft height of them we can take as a medium therefore is too feet and a half, which, even according to Mr Grenves's calculation, who reckons 207 l.ayers, would make 517 feet 6 inches perpendicular height. Melfrs Greaves, Maillet, Thevenot, and Pococke, who only differ in the number of the layers from 207 to 212 , all mounted by the north-cait angle, as the leaft injured. I folluwed the fame rontc, and counted only 208 fteps. But if we reflect that the pyramid has been open on the fide next the defert, that the flones on that fide have been thrown down, that the fand which covers them has formed a confiderable hill, we fhall not be afonified that Albert Liewenfein, Belon, and lrofper Alpinus, who muft have mounted by the fouthenif or fouth weft angle, which are lefs expofed to the fands of Lybia, fhould have found a greater number of iteps: fo that the calculation of thefe travellers, agreeing with that of Diodorus Siculus and Strabo, appears to be neareft the true height of the pyramid taken at its matural bale; whence we may conclude with reafon that it is at leat 600 feet high. Indeed this is authenticated by a paflage of Strabo. Thefe are his words: 'Towards the middle of the height of one of the fides is a fone that may be raifed up. It fhuts an oblique paffage which leads to a collin placed in the centre of the pyramid.' This patfage, open in our days, and which in the time of Strabo was towards the middle of one face of the pyramid, is at prefent only 100 fuet from the bafe. So that the ruins of the covering of the pyramid, and of the ftones brought from within, buried by the fand, have formed a hill in this place 200 feet high. Pliny confirms this opinion. The great fphynx was in his time upwards of $\sigma z$ feet above the furface of the ground. Its whole body is at prefent buried uader the fand. Nothing more appears of it than the neck and head, which are 27 feet high. If even the fphyns, though defended by the pyramids againft the northerly winds, which bring torrents of fand from Libya, be covered as high as $3^{3}$ fect, what an immenfe quantity muft have been heaped up to the northward of an edifice whofe bafe is upwards of 700 feet long? It is to this we mut attribute the prodigious difference between the accounts of the hiftorians who have meafured the great pyranid at diftant periods, and at oppofite angles. Herodotus, who lavy it in the age neareft to its foundation, when its true bafe was thill uncovered, makes it Soo feet fiquare. This opinion appears very probable. Pliny alfo fays that it covered the fpace of eiglt acres.
"Melfrs Shaw, Thevenot, and the other travellers who pretend that this pyramid was never finilhed, becaufe it is open and without coating, are in an error. It is on$I_{y}$ necellary to obferve the remains of the mortar, with the folinters of whie marble which are to be found in

## P Y R

Pyramis. many parts of the fteps, to fee that it has been coated. Alter reading attentively the defeription given of it by the ancients, every doubt vanifhes, and the truth is as clear as day-light. Herodotus tells us, "The great pyramid was covered with polithed ftones, perfectly well jointed, the finalleft of which was 30 feet long. It was built in the form of Iteps, on cach of which were placed wooden machines to raife the flones from one to another.' According to Diodorus, 'The great pyramid is built of ftones, very difficult of workmanflip, but of an eternal duration. It is preferved to our diys (towards the middle of the Auguflan age) withont be ing in the leatt injured. The marble was brought from the quarries of Arabia.' 'Inis hiftorian thought that the whole building was compofed of ftones, fimilar to thore of the coating, which were of very hard marble. Had there been fome pieces torn off, he would have perceived under that covesing a calcareous fone rather foff. Pliny fays that it ' is formed of ftones brought from the quarries of Arabia. It is not far from the village of Bufiris (which ftill exitts under the name of Borfir), where thofe perfons refide who are fo thilful as to climb up to the top.'
"This paffage fhows that Pliny, deceived by the appearance, was in the fame error with Diodorous Siculus. It demenitrates alio that it was covered: for what difficulty would there have been for the inhabitants of Budiris to fcale a building raifed by fteps? but it was really a frodigy for them to get up it when it formed a mountain, the four inclined planes of which prefented a furface covered with polilhed marble. It is indeed an inconteftable fact, that the great pyramid was coated. It is as certain too that it has been fhut, as Strabo gives us to underftand, and that by removing a ftone placed in the middle of one of the lides, one found il palfage which led to the tomb of the king. But I fhall leave Mr Maillet, who vifited it 40 times with all imaginable attention, the honour of relating the means employed to open it. I have examined the infide of it in two different joumers : twice I have mounted it : and I cannot help admiring the fagacity with which that author has dereloped the mechanim of that aftonifhing edifice."

Our author next proceeds to give a particular defeription of the methods by which it is mof probable that the pyramids were clofed and the immenfe labour requifite to open them ; but as this defcription affords nothing very interefting, we fhall not infert it. Only we mint remark, that the final outlet to the workmen Le fuppofes to have been the well at the entrance former!y mentioned. This well defcends towards the bottom of the pyramid by a line not quite perpendicular to the honizon, but ilanting a little, in fuch a manner as to reiemble the figure of the Hebrew letter Lamed. About io feet from the aperture there is a fquare window in th is paflage, from whence we enter a fmall grotto hewn ont of the mountain ; which in this place is not a bolid tone, but a kind of gravel concreted together. The gretto extends about 15 fect from caft to weft, where there is another groove hollowed likewife, but almof perpendiciolar. It is two feet four inches wide by two and an half in height. It defeends through a fpace of I23 feet, aficr which we meet with nothing tut find and fones. M. Savary is convinced that the only ufe of this palfige was to ferve as a retreat for the labourars wio conitrusted the pyramid; and of this he looks
upon the flope of the conduit, its winding roal, its fmallnes, and its depth, to be certain proofs. The way out of it he fuppofes to have been formed by a paffage over which hung a row of Itones, which they had ditcovered the fecret of fufpending, and which falling down into the paflage by the means of fome fpring they fet in mootion, thut up the entrance for ever, as foon as the workmen were withdrawn fiom the pyramid.

It feems to be an unqueftionable fact, that this py. ramid was a maufoleum of one of the kings of Egypt, and it is very probable that all the reft anfwered fimilar purpofes. We do not, however, think that this was their primary ufe or the original defign of their builders. Mr Bryant is of opinion that they were temples ereftel in honour of the Deity; and a very ingenious writer in the Gentleman's Magazine for June 1794 has done much to prove that they were altars dedicated to the fun, the firlt and greateft god in every pagan kalender.
"Our Englim word pramid (fays be) is diredly derived from the Latin pyramis, and mediately from the Greek aupares; all denotingr the lame mathematical figure. The original of the whole feems to be the Egyptian word pyramour, which, we are told by Oriental icholars, fignifies light, or a ray of light. Frons this Coptic vocable the werd wip in Creek, fignifying fire, is probably defcended; as the flames of tire aflume that conical or pyramidal form which the folar rays commonly difplay; and as it is natural for the mind to diftinguifts its objects rather by their external qualities, and thofe obvious aud interefting appearances which they exhibit to the fenfes, than by their conftituent and infeparable properties.
"The ancient Egyptians feen to have penetrated very far into the myfteries of nature; and although their fuperftition appears at firft fight to be extremely grofs and abfurd, yet it is very probable that their deities were only emblematical perfonages, reprefenting by fenfible images the grand effects or prefiding principles which they fuppofed to exift in the univerfe. Thus the moon was called Jis, and the fun Ofiris; and to the honour of this laft deity, from whote vifible influence and creative energy all things feem to fpring into exiftence, it is not improbable that the Egyptians erected thofe ftupendous monuments, and dedicated them to him as temples or altars. It was natural to build them in that fhape which the rays of the fun difplay when difcovered to the eye, and which they obferved to be the fame in terrefrial tlame, becaule this circumflance was combined in their imaginations with the attribute which they adored. If they were temples dediented to the fun, it feems a natural confequence that they thould likewife be places of fepulture for kings and illuttrious men, as the face which they covered would be confidered as confecrated ground. This hypothefis is common, and is not contradicted by the p:efent reafoning. But, confidering themas altars, and as mon travellers agree that they were never finithed, but terminate in a quare horizontal furface, it would not be refining too much to venture an affertion that, in gleat and folemn acts of adoration, the Eiryptians conftucted fires, the flames of which flould termonate in the vertux of the pyramid, and fo complete that emanation of their deity which they admired and adored. As far, therefore, as we are juftified in forming any conciufion on fo darla a fabject,

QUARTER.

17. 1.

ranid. we may venture to fay, that the E.gyptian pyramids were temples or altars dedicated to the fun, as the matetial reprefontative of that invilible power which creates, governs and pervades, the whole !yitem of nature."

This reafoning has great force; and it cortainly receives additimal trength from the undoubted fact, that the firf ftatwes for idolatrous worfhip werecrected on the topes of mountains, and of a pyramidn or conical form. (Siec Polytheism, $n^{\circ}{ }^{1} \mathfrak{j}$ and 21.) It is likewile corroborated by other circumfances diforered by the members of the Afiatic Society. In the feenad volume of their trandetions we have an account of feveral large Aattics of the gods Seeva and Mchedeo, all of a conical or pyramidal figure: but it has been fown in the article already referred to, that the idnlatry of Hindoflan was probably of Egyptian original.

It is not known in Europe when the prramids were built; but we have reafon to expect a hiltory of them foon from Shanfcrit records examined by Mr Wilford lieutenant of engineers. It is as little known at what time, or from what motive, the great pyramid was opened. Some think it was done by one of the khalifs about the beginning of the eighth century, in expectation of finding a great trealure; but all he met with was the king's body, with fomegolden idols which had been buried along with it.-By others it is fuppofed to have been clonc by the ceIebrated Harun Al Bafakid khalif of Bagdad; butall are agreed that this pyramid tras opened in the time of the Arabs. The fecond pyramid has likewife been opened; and an attempt was made not long ago upon the third by one of the Beys of Cairo: but after removing a number of ftones at a confiderable expence, he thought proper to delift from the enterorize. - Ir Brgant is of opinion that the pyramids, at leaft the three great ones, are not artificial itrmetures of fone and mortar, but folid rocks cut into a pyramidal flape, and afterwards cafed with fone; and to this we find that Mr Bruce likewicalfents. The realon given for this opinion is, that the paffiges within it feen rather to anfwer to the natural cavities and rents in rocks than to the artificial ones in buildings. The opinion, however, we think fufficiently confuted by Savary and Mallet: and, as an actete critic obferves, it is in itelef as improbable as that the caverns inhabited by the Troglodytes were dug by the hands of man. See Troglodyres.

On the ealt fide of the fecond pyranid is the fphynx, an enormous mals of one folid fone, but fo buried in the find that on!y the top of the back is vibble, which is Ico feet long. Iis head rifee, as we have feen, 27 feet abore the fand; and iss face has been distigured by the Ara's, who hold all reprefentations of men and living arimals in deteflation. Other travellers lay that this thbye is a loge mifhapen rock, by no means worthy of the attention which has been beftowed upon it.

In the defert of Sacear, there are a great number of pyramids, which, in Mr Rruce's opinion, are compoled of clay. They tembinat in what the inhabitants call a dorgivur, or fulfe jramid, about two miles from the Nile, between Suf and Woodan. This is no other than at hill cat into the thape of a pyramid, or maturally fo formed, for a conliderable height; on the top of which is a pyramidal building of brick terminating in a point, and having its batis fo exactly adapted to the top of the hiil], that at a difance the difference canmot be percciwed; efpecially as the face of the fone refembles very
nearly the clay of which the pyramids of the Sacara lyan are compofed.

PYRAMIDAIES, in amatony, one of the mulo cles of the abolomes. See Anato:iy, Table of ibe Pyrnmetes. Miufcles.

PYRENEAN Mountains, or Proenees, are the mountains which divide lrance from Spain, and are the moft celcbrated in Limrope, except the Alps. They reach from the Mediterrancan Sea as far as the neearl, and are about 212 miles in lengtin. They have difierent names, according to the different places wherein they flard. Some think they are as high as the Alp: but the pafiages over then are not fo diflicult, whatever fome travellers may think who have not crolied the former.

Banksia PYRIformis, in botany, is a fpecies ot bANksia, which fee. It was unknown to Linnzus; and Gaertner, who has mentioned it, gives no fpecific character of it. It has folitary flowers, ovate downy capfules, and lance-fhaped entire fmooth leaves. The capfules larger than in any other known fpecics. Sce llbite's Fournal of a Voyage to Nequ Sonth Wales, p. 221-225.

PYRITES, a genus of inflammable fubftances conipoled of fulphur, which has diffolved or faturated itfelf with metals. Thus there are many kinds of pyrites ; as of gold, arfenic, iron, \&c. It is alfo the principal ore of fulphur ; particularly that called martial pyrites, copperas-flone, or marcofite. This is very common, containing a quantity of fulphur in proportion to the iron; and, when thoroughly inflamed, burns by itelf. It is either of a compact texture, Iteel-grained, coarfe-grained, or cryfallifed. In this laft form it thoots molly into cube and octohedral figures, though1 it is met with allo in innumerable other forms.

The liver-coloured marcafite has an appearance be. tween that of the preceding and the blue copper-orc. The iron predominates in this kind, fo that it is lefs fit than the other for extracting fulphur from it, or for the fmelting of copper-ores. It is formed of a compast texture, coarfe-grained, and feel-grained. Sce CHEmstry, $n^{\circ} 619$ and 65 ; Mineralogy, P. IC9; and Metallurgy, p. $7=9$.

PYRMONT, a town of Lippe in Gemmany, in the circle of Wetphalia, and capital of a country of the fame name. It has a calle, kept by a governor, who i; under the counts of Waldeck. At a imall diftance from hence there are nineral waters, which are much elteemed. The Proteftants have here the free cxercilic of their religion. It is feated on the contines of the duchy of Brunfwic!, 40 miles fouth-wett of Hanover. E. Long. 9. O. N. Lat. ; $^{2}$. 0 .

PYROLA, in botany : is genus of the monngynia order, belonging to the decandria clufs of plants; and in the natural method ranking under the 18 oh order, Bicomts. The calyx is quiaquepartite ; there are five petals; the capfule is quinquetocular, opening at the angles.

PYROMANCY, a lind of divination by means oE fire. See Divisation, n ${ }^{0} 6$.

PYROMETER, an influment for meafuring the expanfion of bodies by hert. See Chemistry, ne 103. Mufchenbrocek, who was the original inventor of this machine, has given a table of the expanfon of the different metals in the fame degree of hat, Having p:e pared cyilndric rods of iron, fteel, copper, brafs, tin, $+R_{2}$
ant:

## P Y R

Pyrometer, and lead, he expofed them firft to a pyrometer with one flame in the middle ; then with two flames; and fucceffively to one with three, four, and five flames. But previons to this trial, he took care to cool them equally, by expoling them fome time upon the fame fone, when it began to freeze, and Fahrenheit's thermometer twas at 32 degrees. The efrects of which experiment are digefted in the following table, where the degrees of expanfion are marked in parts equal to the

| Expanfion of | Iron. | Steel. | Copper. | Brafs. | Tin. | Lead. |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| By one flame | 80 | 85 | 89 | 110 | 153 | 155 |
| By two flames placed clofe together. | 117 | 123 | 15 | 220 |  | 274 |
| By two flame $2 \frac{1}{2}$ inches difant. | 109 | 94 | 92 | 141 | 219 | 263 |
| By three flames placed ciofe together. | 142 | 168 | 193 | 275 |  |  |
| By four flames placed clofe together. | 2 II | 270 | 270 | 36 E |  |  |
| By five fames. | 230 | 310 | 310 | 377 |  |  |

It is to be obferved of tin, that it will eafily melt when heated by two flames placed together. Lead commonly melts with three flames placed together, efpecially if they burnlong.

From thefe experiments, it appears at firf view that iron is the leaft rarefied of any of chefe metals, whether it be heated by one or more flames; and therefore is moft proper for making machines or inftruments which we would have frec from any alterations by heat or cold, as the rods of pendulums for clocks, \&ic. So likevife the maafures of yards or feet fhould be made of iron, that their length may be as nearly as pofible the fame fummer and winter.

The expanfion of lead and tin, by only one flame, is nearly the fame; that is, almolt double of the expaufion of iron. It is likewife obfervable, that the thames placed together, caufe a greater rarefaction than when they have a fenfible interval between them; iron in the former cale, leeing expanded in7 degrees, and only 109 in the latter; the reafon of which difference is obvious.

By comparing the expanfions of the fame metal produced by one, twr, three, or more flames, it appears that two flames do not caufe double the expanfion of oue, nor three flumes three times that expanfon, but always lets; and thefe expanfions ditler fo much the innere from the ratio of the number of flames as there are more flames atting at the farne time.

It is alfo obfervable, that metals are not expanded equally at the time of their melting, but fome more fome lofs. Thus tin began to 1 un when rarecied 219 degrees; whereas brafs was expanded 377 degrees, and yetwas far from melting.

Mr Ellicot found, upon a medium, that the expan- Pyrom fion of bars of different metals, as nearly of the fame dimenfions as pollible, by the fame degree of heat, were as follow:

Gold, Silver, Brafs, Copper, Iron, Steel, Lead,
$\begin{array}{lllllll}73 & 103 & 95 & 89 & 60 & 50 & 149\end{array}$
The great difference between the expanfions of iron and brafs has been applied with grood fuccefs to remedy the irregularities in pendulums arifing from heat. See Prindulum.

Mr Graham ufed to meafure the minute alterations, in length, of metal bars, by advancing the point of a micrometer-ferew, till it fenfibly ftopped againft the end of the bar to be meafured. This fcrew, being fmall and very lightly lung, was capable of agrecment within the thee or four-thoufandth part of an inch. On this general principle Mr Smeaton contrived his pyrometer, in which the meafures are determined by the contact of a piece of metal with the point of a mi-crometer-fcrew.

The following table flows how much a foot in length of edeh metal grows longer by an increafe of heat, correfponding to $180^{\circ}$ of Fahrenheit's thermometer, or to the difcrence between freczing and boiling water, expreffed in fuch parts of which the unit is equal to the Io,000th part of an inch.

We thall clofe this article with a bricf defcription of a pyrometer lately invented by M. De Luc, in confequence of a hint figgelied to him by Mr Ramfden. The bafis of this inftrmment is a rectangular piece of deal-board two feet and a half long, 15 inches broad, and one inch and a half thick: and to this all the other parts are fixed. This is mounted in the manner of a table, with four deal legs, each a foot long and an inch and a half fquare, well fited near its fom angles, and kept together at the other ends by four firm crofspieces. This imall table is fufpended by a hook io a Itand; the bourd being in a vertical fituation in the direation of its rrain, and bearing its legs forward in fuch a mamer as that the crols-pieces which join them may form a frame, placed vertically facing the obferver. I'h's frame futains a microfope, which is fum! fixed in another frame that moves in the former by meins of groores, but with a very confiderable degrec of tight.
-aneter, nefs ; the fistion of which may be increafed by the 1opho- preffure of four ferews. The inner fliding frame, which is likewife of deal, kecps the tube of the microfeope in a horizontal pofition, and in great part without the frame, monnuch that the end which carries the lens is but little within the face between the frame and the board. This microlcope is conllucted in fuch a manner as that the ohjest obferved may be sun inch diftant from the lens; amd it has a wire which is fituated in the foous of the glalies, in which the objects appear reverfed. At the top of the apparatus there is a piece of deal, an inch and a half thick and two inches broad, laid in a horizontal dircetion from the board to the top of the frame. To this piece the rods of the different fubltances, whole expmition by heat is to be meafured, are fufpended : one end of it ilices into a focket, which is cut in the thicknefs of the board; and the other end, which relts upon the frame, meets there with a forew, which makes the piece move backward and forward, to bring the objects to the focus of the microfcope. There is a cork very ftrongly driven through a hole bored vertically through this piece; and in another vertical hole mate through the cork, the rods are fixed at the top; to that they lang only, and their dilatation is not counterafted by any preflure. In order to heat the rods, a cylindrical bottle of thin glafs, about 21 inches high, and frur inches in diameter, is placed in the infide of the machine, upon a fland independent of the reft of the apparatus. In this bottle the rods are fufpended at a littie leis han an inch diftance from one of the infides, in order to have them near the microfope. Into this bottle is poured water of different degrees of heat, which mult be ftirred about, by moving upwards and downwards, at one of the fides of the bottle, a little piece of wood, fattened horizontally at the end of a ftick: in this water is hung a themometer, the ball of which reaches to the middle of the height of the rods. During thefe operations the water rifes to the cork, which thus determines the length of the heated part; the bottle is covered, to prevent the water from cooling too rapidly at the furface; and it thin cafe of brafs prevents the vapour from fixing upon the pisce of deal to which the rods are fixed.

PYROPHORUS, formed of avp, fire, and $\epsilon_{\xi} a, I$ bear, in chemiftry, the name ufually given to that fubflance called by fome black phofphorus; a chemical preparation polfeffing the lingular property of kindling fpontaneoufly when expofed to the air. See ChemtsTRY, $n^{\circ}$ 1414.
'This fubftance was accidentally difcorered by M. Homberg, who prepared it of alum and human fæces. See Phosphorus. It was apprehended, for a confiderable rime after the difcovery, that human feces were effential to the operation, till the youngeft fon of the great Lemeri found that honcy, fugar, flour, and indeed any animal or vegetable matter, might be fubfituted inltead of the luman freces; and fince that time, M. De Sauvigny has fhown that moft vitriolic falts may le fubltituted for the alum; having added to the alumincus pyrophorus of Homberg two other clafes of fubftances of this kind, viz. the metallic, or thofe made with the three vitriols of iron, copper, and zinc; and the nentral, or thofe compofed of vitriolated tartir and Clauber's filt.

Mr Bewly prepares his pyrophorus in the fuidowing Pjropho manner. "I fill (fays he) half or threefouths of the bowl of a tobacco-pipe with a mixture, confilting of two farts of alum, previounly calcined in a red.heat, and of powdered charcoal and falt of tartar each one part ; prefling the matter down nightly, and alling the remainder of the bowl with finc find. As foon as the powiler becomes hot, the fand lying over it is fut into a fatc of challition, which generally continues ieveral minutes. This appearimec feems to proceed partly fom the vitriolic acidin the alum leaving its carth, and es. pelling fixed air fiom the alkali; while another part of it is polibly converted into viriolic acit air. 'Ihis plenomenon is fucceeded by the appearance of a blue fulphureous flame, proceeding from the combination of the fame acid with what was formerly called the fhlugiflon of the coal, and which continues about ten minutes or a quarter of an hour. After it cedfes, no other remarkable appearance prefents itfelf. The matter is now to be kept in a red heat 20 minutes or half an hour ; or it may continue there two hours longer, if the operator pleafes, without any injury to the pyrophorus. 'The pipe being taken out of the fire, the matter is knocked out of it as foon as it becomes cool, and generally pretty foon afterwards takes fire fipontaneoully."

In another experiment, having added fucceffively various and increaling quantities of fixed alkali to the fale heated as above, till the vitriolic acid contaned in the mixture might be confidered merely as an evane. fcent quantity, a pyrophorns was ftill produced on calcining it with charcoal as before. He alfo mixed equal parts of falt of tartar and vegetable or animal coal, or fometimes three parts of the former with two of the latter, and calcined them in the ufual mannar: and this compolition, on being expofed to the air, generally kindled in half a minute or a minute ; though, as it contained no fulphur, it did not burn with fo much vivacity as the vitriolic pyrophori. This, which Mr Bewly calls the alkaline prophorus, differs in no circumftance from M. De Sauvigny's neutral pyıopho. ri, except in its not containing that principle to which he afcribes their afcenfion. However, left it might be fufpected that the falt of tartar which he cmployed might accidentally contain vitriolated tastar, or $\mathrm{i}_{\mathrm{i}}$ triolic acid, he repeated the experiment with tantar calcined by himfelf, as well as with nitre fixed or alki:lifed by deflagration with charcoal, and with irnn filings; and in all thefe cafes with the fane refult. Dy diverffying in a like manmer M. De Sauvigny's ex. periments on the snetallic pyrophori, Mr Bewly found that none of the three vitricls, heated with charcoal alone, in his utioal method, could produce a pyropliorus. And thus he found that the addition of an alkaline falt to the compoftion, which was a part oi M. De Sanvigny's procels, was cffential to its fuccefs.

Treating in the utual manner equal parts of calcinect green vitriol and cinarcoal, the powder, which contained no fulphur nor hepar fulphuris, did not acquire any of the propertics of a pyrophorus. The sitrinlic acid focmed to have been entirely dilinated, having no bafe to detain it, when diflodged from the metallic earth. The chancoal and calx of iron left in this proceis were calcined again, tegether with fome foll of tartar: and a gyrophorus was produced, which exlio bited indications of its containing a fasce perectrible
 rui.
portion of hepar fulphuris. 'thirty grains of crocus martis allringens werc calcincd with 15 grains of charcral, and the fime quantity of falt of tartar; and the mixture burnt $f_{j}$ ontancoufly, though it contained no hepar iulphais or vituiolic acid. Having by thefe experiments crinced that metallic pyophori may be prepared without vitriolic acid, Mr Bewly proceeded in form an aluminous pyrophorus of the fame kind. For this purpofe he procued the earth of alum by a Ionx and violent calcination; and examining a part of it, he found, by the ufual tefts, that it neither conlained any fulphur, hepar fulphuris, nor alum undecompomuded. This he confidered as perfeetly pare, though he afterwards found that it contained a imall quaritity of vitriclated tartar; and yet it repeatedly furnilhed a pyrophons, as aftive as when alum ittelf is employed. From thefe and fimilitr experiments, he infers, that the feveral kinds of fyrophori are not kind3ed by moifure, attracted by the vitroilic acid, as M. De Sauvigny has maintained: and his conclufion is farther confirmed by fome experiments of Dr Inieftley; from which it appears, that they are kindled in dry, nitrous, and what he calls deplogiticated air.
M. Proutt, cited by Mr Bewly, deferibes a variety of now pyrophori, which neither contain vitriolic acid, nor fecm likely to owe their accention to the attraction of humidity from the air. Thefe principally confift of a coaly matter fimply divided by metallic or other earths; fuch are the fediment left on the filter in preparing Goulard's extract, various combinations of tartar or its acid, or the acetous acid, with metals, calca1 cous earth, sic.

Mr Rewly, having evinced the infuficiency of M. De Sauvigny's theory, and difcovered that the pyrophori are not hindled by moifture, atracted (merely) by the vitriolic acid, directed his attention to the niwous atcid, which 1)r Priefly has thown to be a conftituent part of atmofherical air, as the probable agent in the production of this phenomenon. The firong affinity which this acid has with phlogifon, and the hear, and even flame, which it is hown to produce with centain inflammable matters, manifofed that it was cupal to the effect ; and having excluded the vitriolic aciul from laving any effential concern in this operafion, he fuggefts, either that the pyrophorus is kindIcd by moillure attrafted by fime of the other ingredients which compofe it; or that it has the power of decompounding atmof herical air, by diedenly attracting its mitrous acid, :nd thercby generating a heat fufficient to kincle the phogiffic matter contained in is. This idea appeared plautible, when he farther contidered that $\mathrm{DI}_{1}$ Prictley produced the purelt refpizable air with this fame acid cembincd with other principles; and that this as weil as common air is diminifhed, and probahly in part decompounded, in a variety of Thogittic paceffes. This ingenious writer concludes, upon the whole, from the experiments he hath made, that the pyrophorus feems to owe its fingular property 10 its being a combination of earth or alkali with phlo. iftur : the vitriolic acid, when preient, only occationatly increating or diminithing the effee, according to circumflances. In the procefs of calcination, the eath or alkaline principle is not mercly mixed, hat actually, though loofely, combined with the phlogiftic principle of the coal; fo that the pyrophoms,
confulering it in its molt fimple ftate, is only a ferfect. ly dry fhlogititicated alkali or eath. On there data, the phenomena may be explained in the two following methods; with refpect particularly to the influence of moifure and heat upon the pyrophorus. Suppofing either the alkaline or earthy principle to have a greater affinity to water than to the phlogifion with which either of them is united, they may, on being expofed to a moift atmofphere, attract the humidity, and thereby fet the phlogiltic principle at liberty; which may, in its turn, attratt, and be ignited by, the fuppofed aerial acid ; its ftrong affinity to which is well known :-or, if this hypothefis te rejected, the inflammable matter may be kindled, merely in confequence of the heat produced by the combination of the alkali, \&cc. with moifture.
Mr Keir gives the following d.fription of a procefs for preparing a new pyrophorus which he has lately difcovered: "I filled about five-fixths of the contents of a copper cyliadrical box, which had a lid fitted to it, and which was three inches in diameter and two inches in cepth, with faw-duft, which I preffed down; and I laid upoa the faw-dult as much well-wathed plumbum corneum as entirely filled the box, which I then covered with its lid. I placed the box on the coals of a cham-ber-fire, fo that its bottom only fhould be in contact with the fuel, and I kept it on the fire till no more vapour feemed to iffue at the joining of the lid. I then removed it from the fire ; and while it was hot, I clofed up the joining of the lid with fealing-wax, by which means the external air was excluded. After it had food in the cold about ten hours, I opened the box; and the comeons lead, which was very white before the operation, was now rendered black by the vapour which had arifen from the faw-duft, and which was obliged to pars througl the lead before it could efc:ape. This black metallic mafs was no fooner expofed to the air, than ig. nited fparks appeared, which fpread more and more, while the lead was feen to revive in the form of minute globules, ard the part which did not icvive was changed into a yellow powder or cal. of lead. It is to be obferved, that before I opened the bor, I placed it at the fide of the fire, in order to melt the fealing wax, to enable me to feparate the lid. It is pofible that this fmall dogree of heat may be neceffary, 'or conducive, to the accenfion. I ought alfo to acquaint you, that the preparation of this pyrophorus requires nicer attention than that of any which I am acquinted with. For a fmill excefs of heat will revive the lead, which will fpoil the experiment. Alfo, If any air be adnaitted through the joints of the veffls employed, the kinding property will be prevented by the abtorption of the air; which in this cafe is generally too gradual to produce inflammation. The metallic fubfance in this fate of impregnation with infammable matter, alhough not a pyro. phorus, is an exceeding q̧utick tinder. For when touchcd, however flighth, by an ignited body, it will inftantly lindle, and the fire will fpead over the whole piece, reviving the lead wherever it gocs, and exhibiting a very beautiful cxample of metallic reduction, not unlike the familiar experiment of reviving the lead of a wafer containiog minium at the flame of a candle ; but with this dilercnce, that the firc in the wafer requires to be kept up by llame; whereas in this metallic tinder it fpreads and crepps fi:cntaneoutly along without flame ower the mafs.

PYROTECHNY;

## P Y R O T E C H N Y;

$=T$HE art of fire, or a fcience which te:aches the manayement and application of fire in feveral operarations. Sce Fire, Furnace, Chemistry, Distillation, Merallurgy, isc.

But the telm is more particularly ufed to denote the doctrine of artificial fire-works and fire arms teaching the fruqure and ufe, I. Of thofe uled in war, the attacking of fortifications, \&c. for which fee the articles Fusee, Gun, Gonsery, Gunpowder, Mine, sc.; :und, 2. Of thofe male for amufenent's fake, as rockets, thars, ferpents, \&c. the preparation and confruction of which fall to be explained in the prefen tarticle.

Spcr. I. Of Ingredicnts an.l Comityitions.
I. Saltpeitre.

Saltpetre being the principal ingredient in fireworks, and a volatile bady, by reafon of its aquenus and aerial parts, is eatily rarefied by fire ; but not fo foon when toul and grofs as when purified from its crude and earthy parts, which greatly retard its velocity: thercfore, when any quantity of fire-works are to be made, it lhould be examined; for if it is not well cleanfed, and of a good fort, your works will not have their proper effect ; neither will it agree with the flanding proportions of compofitions. Therefore,

To refine it, put into a copper, or any other veffel, 100 lb . of rough nitre with 14 gallons of clean water; let it boil gently half an hom, and as it boils take off the fcum ; then fir it, and before it fettles put it into your filtering bags, which mutt be hung on a rack, with glazed earthen pans under them, in which muft be fticks laid acrofs for the cryfals to adhere to: it muft fland in the pans two or three days to fhoot ; then take out the cryfals, and let then dry. The water that remains in the pans boil again an hour, and frain it into the pans as before, and the falpetre will be quite clear and tranfparent; if not, it wants more refining; to do which proceed as ufual, till it is well cleanfed of all its earthy parts.
N. B. Thoie who do not choofe to procure their filtpetre by the above method, may buy it ready done, which for tire-works in general will do.

To pukerize Saltpetre. Take a copper kettle, whofe botom mult be fphacrical, and put into it $1+\mathrm{ib}$. of refined faltpetre, with 2 quarts or 5 pints of clean water : then put the kettle on a flow fire ; and when the faltpetre is diffolved, if any impurities arife, ikim them off, and keep conflantly firring with two large fatulas, till all the water exhales; and when done enongh, it will appear like white find, and as fine as Rour ; but if it hrould boil too fuft, take the kette off the fire, and fet it on fome wet fand, which will prevent the nitre from fticking to the ke:tle. When you have pulverifed a quantity of faltpetre, be careful to keep it in a dry place.

To exirat Salpetre from damaged Gumpowdir. Have fome filtering bags, hung on a rack, wilh glazed earthen pans under them, in the dame manner as thofe
for refining faltpetre; then take any quantity of da. hagredients maged powder, and put it into a copper, with as much and clean water as will cover it: when it begins to boil, Comporstake off the feum ; and after it has boiled a fiw minutes, tions. ftir it up): then take it out of the copper with a fmall hand-kcttle for that purpofe, and put fome into eaclo bag, beginning at one end of the rack, fo that by the time you have got to the laft bag, the firt will be ready for more. Continue thus till all the bags are full : then take the liquor out of the pans; which boil and filter, as before, two or three times, till the water run quite clear, which you muft let fland in the pan fome time, and the faltpetre will appear at top. 'I'o get the faltpetre entirely out of the powder, take the water from that already extracted, to which add fome frefh and the dregs of the powder that remain in the bags, and put them in a veffel, to fland as long as you pleafe : and when you want to extraft the nitre, you mult proceed with this mixture as with the powder at firl, by which means you will draw out all the faltpetre; but this pro. cefs mu!t be boiled longer than the firt.
2. Sulphur, or Brimflane.

Sulphur is one of the principul ingredients in gunpowder, and almoft in all compofitions of fire-works; and therefore great care muft be taken of its being good, and brought to the bigheft perfection. To know when fulphur is good, you are to obferve that it is of a high yellow ; and if, when held in one's hand, it crackles and bounces, it is a fign that it is frefh and good: but as the method of reducing brimfone to a powder is very troublefome, it is better to buy the flour ready made, which is done in large quantities, and in great perfection; though when a grand collection of fire-works are to be made, the Atrongeft and ben fulphur is the lump brimfone ground in the manuer di. rected in art. 8.

## 3. Charcoal.

Charcoal is a prefervative by which the faltpetre and the brimitane are made into gunpowder, by preventing the fulphur from fuffocating the frong and windy exhalation of the nitre. Charcoal for fire-works muft always be foft and well burnt, which may be buught ready done.
4. Gunpoweder.

See Gunpowdea in the order of the alphabet. To grind or meal it, is directed in art. $\delta$.
5. Campor.

This may be had in the lhops; and is of two kince, differing in regard to the degree of their purity, and diftinguifhed by the name of rough and refned. Refined camphor mut be chofen of a periealy clean white colour, very bright and pellacid, of the fane imell and taite with the rough, but more acrid and pangent. It is fo volatile, that merchants ufinally inclofe it in linteed, that the vifcofity of that grain m.1y keep its purticles together.
6. Benjamin.

This is a refin found of different furts; and diftin. guifhed by their colours, viz. yellow, grey, and brown $\hat{F}$ Gut the beft is that whick is cafy to break, and full of

Ingredicnts white ipats. It is ane of the ingredients in odoriferous and
Compoif.
tions.
fire-works, when reduced to a finc flour; which may be done by puting into a deep and narrow earthon pot 3 or 4 oz. of benjamin grofsly pounded ; cover the pot
with paper, which tie very clefe round the edge ; then fet the pot on a flow firc, and once in an hour take of the paper, and you will fiad fome flour Micking to it, which return agrain in the pot; this you mult continue till the four appears white and fine. There is alfo an oil of banjamin, which is fometimes drawn from the dregs of the flou: ; it affords a very good feent, and maly be ufed in wet compofitions.

## 7. Spur-firc.

This fire is the moft beatiful and curions of any yet known; and was invented by the Chinefe, but now is in greater perfection in England than in Chinn. As it requires great trouble to make it to perfection, it will be necefary that beginners thould have full initrucLions; therefore care thould be taken that all the ingredients are of the beft, that the lamp-black is not damp and cloded, that the foltpetre and brimfone are thoroughly refined. This compofition is generally rammed in 1 or 2 oz . cafes about 5 or 6 inches long, but not drove very hard; and the cafes mult have their concave froke fruck very fmooth, and the choak or vent not quite fo large as the ufual proportion : this charge, when driven and kept a few months, will be much better than when rammed; and will not fpoil, if f.cpe dry, in many jears.

Asthe beatuty of this compofition cannot be feen at fo great difance as brilliant fire, it has a better effet in a room than in the open air, and may be fired in as chamber without any danger: it is of fo innocent a nature, that, though with an improper phrafe, it muy be called a coill fire; and fo extroordinary is the fire produced from this compontion, that, if well made, the fparks will not burn a handkerchief when held in the mid! of them; you may hold them in your hand while buming, with as much fafety as a candle ; and if you put your hand within a foot of the mouth of the cafe, you will fecl the fparks like drops of rain. When any of thefe fpur-fires are fired fingly, they are called artificial flower-pots; but fone of them placed round a tianfparent pyramid of praper, and fired in a large room, make a pretty appearance.

The compofition contifs of taltpetre 4 lb .8 oz . fulphur 2 lb . and lamp-black $1 \mathrm{lb} .8 \mathrm{oz}$. ; or, faltpetre 1 ib . furthur $\frac{1}{5} \mathrm{lb}$. and lamp-black 4 quarts. This compoftion is very dificult to mix. The filltpetre and brimkone mult be firf fifted together, and then put ints a marble mortar, and the lamp-black with hiem, which you work down by degrees with a wooden pefte, till all the ingredients appear of one colour, which will be fomething greyifh, but very near black: then drive a little into a cafe for trial, and li.e it in a dark phace; and if the fpaks, which are called flars, or fink, conce rut in clufters, and afterwards fpread well without any other frarks, it is a fign of its being good, otherwie not ; for if any drufly parks appear, and the fars not full, it is then not mixed enough; but it the pinks are very fimall, and foon break, it is a fign that yon have rubbed it too much.

This misture, when rubbed too much, will be too fierce, and hardiy thow any !tars ; and, on the contrary, when not mixed enough, will be too weak, and

## E C H N Y.

throw out an obfcure fmuke, and lumps of drofs, with- Ingr outany fars. The reafon of this charge being ealled the fpur-fire, is becaufe the fparks it yields have it great refemblance to the rowel of a fpur, from whence it takes its name.
8. To meal Gunpowder, Drimfone, and Charcoal.

There have been many methods ufed to grind there ingredients to a powder for fire-works, fuch as large mortars and peftles made of ebony and other Lard wood, and horizontal mills with brals barrels: but none lave proved fo effectual and fpeedy as the laft invention, that of the mealing-table, reprefented in fig. t . made of cln, with a rim round its edge 4 or 5 inches cceca high; and at the narrow end $A$, is a flider that runs in a groove, and forms part of the rinu: fo that when you have taken out of the table as much powder as you can with the copper fhovel (fig. 2.) fiveep all clean out at the flider A. When you are going to meal a quantity of powder, obferve not to put too much in the table at once; but when you have put in a good proportion, take the muller (fig. 3.) and rub it till all the grains are broke; then fearce it in a lawn fieve that has a receiver and top to it ; and that which does not pafs through the fieve, return again to the tab!c, and grind it till you have brought it all fine enough to go through the fieve. Drimfone and charcoal are ground in the fame manner, only the muller muft be made of chony; for thefe ingredients being harder than powder, would ftick in the grain of elm, and be difficult to grind. As brimftome is apt to ftick and clod to the table, it will be bett to keep one for that purpofe, by which means you will always have your brimfone clean and well ground.

2d S. To make IWhecls and other Works incombufiil:.
It being necelfary, when your works are new, to paint them of fome dark colour ; therefore, if, inftead of which, you make ufe of the following compolition, it will give them a good colour, and in a great meafure prevent their taking fire fo foon as if painted. Take brick duft, coal-athes, and iron-filings, of each an equal quantity, and mix them with a double fize, made hot. With this wafl over your works, and when dry wath them nver again; this will preferve the wood greatly againit fire. Let the buick-duft and athes be beat to a fine powder.
9. To prepare Call-iron for Gerbes, wbite Foumains, and Chinefe Firc.
Calt iron being of fo liard a nature as not to he cut by a file, we are obliged to reduce it into grains, though fomewhat difficult to perform ; but if we conlider what beantiful farks this fort of iron yields, no pains fhould be fpared to granulate fush an effen ial material: to do which, get at an iron foundery fome thin pieces of iron, fuch as gencrally run over the mould at the time of cafting: then have a fquare block made of catt iron, and an iron fuare hammer ahout four lb. weight; then, haviner covered the flocr with cloth or fomething to catch the beatings, lay the thin pieces of iron on the block, and beat them with the hammer till reduced into a fmall grains; which afterwards fearce with a very fine fieve, to feparate the fine dult, which is fometimes ufed in fmall cafes of brilliant tire, inftead of ftcel duft; and when you have got out all the duf, fift what remains with a fieve a Iittle larger, and fo on with fieves of different fizes,
lients till the iron paffes through about the bignclis of fmall :om- bird-hot: your iron thas beat and fited, put cach Us. fout into wooden boses or oild paper, to keep it from rufting. Whan you ufe it, obferve the difference of its fize, in proportion to the cafes for which the charge is i.tended; for the coarfe fort is only defigned for vary large gerbes of 6 or 8 lb .

## 10. Clarges fur Sky-rockets, \&ec.

Rock is of four omaces. Mealed powder 1 1b. 402. filtpetre $4 \mathrm{~L}_{2}$. and charcoal 2 oz .
liock:is of eisht caticcrs. I. Mealed powder I lb. faltpetre 4 oz . brimane 3 oz . and charcoal $1 \% \mathrm{o} \%$ IL. Meal-powder $1 \frac{1}{2}$ th. and charcoal $4 \frac{7}{\frac{7}{4}} \mathrm{nz}$.

Rockess of one poun.l. Mcal-powder 2 lb . faltpetre 8 o\%. brimtone $40 \%$. charcoal 2 oz. and ftel-filings $1 \frac{1}{2}$ (12).
Skj. $\mathrm{r}_{\mathrm{c}}$ ckets in general. I. Saitpetre 4 lb . brimRone 115. anj charcoal $1 \div 1 \mathrm{lb}$. II. Saltpetre 4 lb . brimfone $1_{2}^{\frac{1}{2}} \mathrm{lb}$. charcoal I lb .12 oz . and meal-powder $20 z$.

Large fay rock:/s. Salt-petre + lb. meal-powder i lb. andbrimitone 1 lb .

Rockets of a middling fize. I. Saltperre 8 lb . fulphur 3 lb . meal-powder 3 lb . II. Saltpetre 3 lb . fulphur 2 lb . meal fowder 1 lb . charcoall lb .

## 11. For Rockel Stars.

White fars. Meal-powder 4 oz. faltpetre 12 oz . -fulphur vivum 6 oz . oil of fike 2 oz . and camphor 5 oz. Blue Stars. Meal-powder 8 oz. faltpetre 4 , fulphur 2 , fpirit of wine 2 , and oil of fpike 2 .

Coloured or variesated flars. Meal-powder 8 drams, rochpetre 4 oz . fulphur vivum 2, and camphor 2 .
Brilliant flars. Saltpetre $3^{\frac{1}{2}}$ oz. fulphur $1 \frac{1}{2}$, and meal-powder $\frac{3}{2}$, worked up with fpirits of wine only.

Common farts. Saltpetre 1 lb . brimfone 4 oz . antimnny $4 \frac{1}{4}$, ifinglafs $\because$, camphor $\frac{1}{2}$. and firit of wine $\frac{3}{4}$.

Tailed flars. Meal powder 3 oz . brimftone 2 , faltpetre 1 , and charcoal (coarfely ground) $\frac{3}{4}$.

Droze flars. I. Saltpetre 3 lb . fulphur 1 lb . brafs dult 12 nz. antimony 3. If. Saltpetre 1 lb. antimony 4 oz . and fulphur 8.

Fixed pointed flars. Saltpetre $8 \frac{1}{2}$ oz. fulphur 2, antimony I oz. 10 dr.

Stars of a fine colour. Sulphur 1 oz. meal-powder 1, faltretre 1 , camphor 4 dr . oil of turpentine 4 dr . 12. Rains.

Goll rain for fiy rockcts. I. Saltpetre 1 lb. mealpowder 4 oz. fulphur 4 , brafs-dult 1, faw-duft $2 \frac{\text { I }}{4}$, and glafs-duft 6 dr. II. Meal-powder 12 oz. faltpatre 2, charcoal 4. III. Saltpetre 8 oz . brimftone 2 , glafs.duft 1 , antimon ${ }^{\frac{3}{4}}$, brafs-duft $\frac{5}{4}$, and faw-duft 12 dr .

Silver rain. I. Saltpetre 4 oz. fulphur, meal-pow. der, and antimony, of each 2 oz . fal prunella $\frac{1}{2} \mathrm{oz}$. II. Saltpetre $\frac{1}{2} \mathrm{lb}$. brimftone 2 oz . and charcoal 4. III. Saltpetre 1 lb . brimfone $\ddagger \mathrm{lb}$. antimony 6 oz . IV. Saltperte 4 oz , brimftone 1 , powder 2 , and fleelduft $\frac{3}{4} \mathrm{oz}$.
13. Water Rockets.
I. Meal-powder 6 lb . faltpetre 4 , brimfone 3, charcoal 5. II. Saltpetre I lb. brimfone $4 \frac{1}{5} \mathrm{oz}$. charcoal 6. III. Saltpetre I lb. brimftone 4 oz . charcoal 12. IV. Saltpetre 4 lb . brimitone I; lb. charcoal I lb. 12

VoL. XV.
oz. V. Drimitone 2 lb . faltepere 4 l's. and meni. I
 brimatone 85, charconl 2. T!I. Meal-powder it 1 b . faltetre 3, brimilone 1 ; fea coral i w\%. charcoal S',
 Vili. Meal-powder $\mathrm{I}^{3} \frac{\mathrm{lb}}{}$. faltpetre 3, fulphur $1 \frac{1}{2}$, charcoal $120 \%$. fav-dult 2.

Sirking charge for medter-rockics. Meal-powder Sot. charcoal $\frac{\mathrm{oz} \text {. }}{}$

## 14. Of llibuls.

Wheel cafes fiom truo ources to four pousds. I. Meatpowder 2 lb . Caltpetre +0 oz. iron-filings 7. II. Mealpowder 2 lb . faltpetre 12 oz . fulphur 4 , Reel-duft 3. III. Neal powder +1 lb . filtpetre 1 lb . brimftone $80 \%$. charcoal $4 \frac{1}{2}$. IV. Meal-powder 8 oz. faltpetre 4, fiwwduft $1 \frac{1}{4}$, fea-coal $\frac{3}{4}$. V. Meal.powder I lb. +oz . brimftone 4 oz. 10 dr. faltpetre 8 oz. glafs-duft $2 \frac{x}{2}$. VI. Meal-powder 12 oz . charcoal 1, faw-duft, $\because$ Vli. Saltpetre i lb. 9 oz . brimfone 4 oz . charcoal 4 . VIII. Meal-powder 2 lb . faltpetre 1 , brimtone $\frac{r}{2}$, and fea-coal 2 oz . LX. Saltpetre 2 lb . brimfone 1, mealpowder 4 , and glafs-duft 4 oz. X. Mcal-powder I lb. faltpetre 2 oz, and fleel-dult $3^{\frac{1}{2}}$. XI. Meal-powder 2 lb . and fleel-dult $2 \frac{1}{2} \mathrm{oz}$. with $2 \frac{1}{2}$ of the fine duft of beat iron. XII. Saltpetre 2 lb .13 Oz , brimfone 8 oz. and charcoal.

Slowe fire for zubsels. I. Saltpetre 4 oz. brimftone 2, and meal-powder $1 \frac{1}{2}$. I1. Saltpetre 40 . brimftone 1 , and antimony ${ }^{1}$ oz. 6 dr. Ill. Saltpetre $4 \frac{1}{2}$ oz. brimfone 1 oz . and mealed powder $1 \frac{\mathrm{~T}}{\frac{1}{9}}$.
Dead fire for qubeels. 1. Saltpetre $1 \frac{2}{4} 0 \mathrm{z}$. brimfone $\frac{1}{4}$. lapis-calaminaris $\frac{1}{4}$, and antimony 2 dr .

$$
15 \text { Standing or fixed Cafes. }
$$

I. Meal-powder 4 lb . faltpetre 2 , brimflone and charcoal 1. II. Meal-powder 21 lb . faltpetre 1, and fleel-dult 8 oz. III. Meal-powder i lb. 4 oz. and charcoal 4 oz . IV. Meal-powder I lb. and Recl-duft 4 oz . V. Meal-powder 2; lb. brimfone 4 oz . and fea-coal 6. VI. Meal-powder 3. Ib charcoal 5 . oz and faw-duft $1 \frac{1}{2}$.

## 16. Sun Cafes.

I. Meal-powder $\oint_{\frac{1}{2}} \mathrm{lb}$. faltpetre 1 lb .2 oz . Aeel. dult 2 lb . 10 oz . brimftone 4 . II. Meal-powder 3 lb . faltpetre 6 oz . and fteel-duft $7 \frac{1}{2}$.

## 17. A brilliant Fire.

Meal-powder in lb. Faltpetre I, brimftone 4 oz . fteelduft $1 \div \mathrm{lb}$.

> 18. Gerbes.

Meal-powder 6 lb . and beat-iron 2 lb . $1 \frac{1}{\tau}$ oz.
19. Clinefe Firc.

Saltpetre 12 oz . meal-powder 2 lb . brimfone 1 lb : 2 oz . and beat iron 12 oz .

## 2c. Tourbillons.

Charge for four-onnce Tourbillons. Meal-powder 2 lb . 4 oz . and charcoal 4: oz.
Eight-ounce Tourtillons. Meal-powder 2 lb . and chareoal $4 \frac{3}{4} \mathrm{oz}$.

Large Tourbillons. Meal-powder 2 lb . faltpetre 1, brimftone 8 oz . and beat iron 8.
N. B. Tourbillons may be made very large, and of different coloured fires: only you are to obferve, that the larger they are, the weaker muft be the charge; and, on the contrary, the fmalier, the ftronger their charge.
21. Water Balloons.

1. Saltpetre 4 lb . brimitone 2 , meal-powder 2, antimony 40 . faw-duft 4 , and glafs-duft $\mathrm{I}_{4}^{\frac{1}{4}}$. II. Saltpetre 9 lb . brimftone 3 lb . meal-powder 6 lb . sofin 12 oz . and antimony 807.
2. Water Squibs.
I. Meal-powder i lb, and charcoal i lb. II. Mealpowder i lb, and charcanl 9 oz .
3. Mine Ports or Serpents.
I. Meal-powder 1 lb. and charcoal 1 oz. II. Mcalpowder 9 oz. charcoal 1 oz.
4. Port-fircs.

For firing rockets, \&cc. I. Saltpetre 12 oz . brimfone 4 oz. and meal-powder $20 \%$. II. Saltpetre 8 oz . brimftone 4 oz . and meal powder 2 oz . III. Saltpetre 1 lb .2 oz. meal powder $\mathrm{I}_{2}^{\prime} \mathrm{lb}$. and brimftone Io oz. This compofition muft be moiftened with one grill of lintfeed nil. IV. Meal-powder 6 oz . faltpetre 2 lb .2 oz . and brimftone 10.0 z . V. Saltpetre 1 lb. 4 oz . meal-powder 4 oz . brimftone 5 oz . faw-dult 8 oz . VI. Saltpetre 8 oz . brimftone 2 oz . and meal-powder 2 oz.

For illuminations. Saltpetre 1 lb . brimitone 8 oz . and meal-powder 6 oz .
25. Cones or Spiral Wheels.

Saltpetre $1 \frac{3}{2} \mathrm{lb}$. brimftone 6 oz . meal-powder 14 oz . and glafs-duft 14 oz .
26. Growns or Globes.

Saltpetre 6 oz . brimitone 2 lb . antimony 4 oz . and camphor 2 OZ .

## 27. Air Balloon Fuzes.

I. Saltpetre i lb. 10 oz . brimftone 8 oz . and mealpowder I lb . 6 oz . II. Saltpetre $1 \frac{1}{2} \mathrm{lb}$. brimitone 8 oz . and meal-powder I lb. 8 oz .
28. Serpents for Pots des Brins.

Meal-powder i lb. 8 oz. faltpetre 12 oz . and charcoal 2 oz.

## 29. Fire pumps.

I. Saltpetre 5 lb . brimitone 1 lb . meal-powder $\mathrm{I} \frac{\mathrm{x}}{2} \mathrm{lb}$. and glafs-duft 1 lb . II. Saltpetre 5 lb .8 oz . brimAtone 2 lb . meal-powder i lb. 8 oz . and glafs-dult tlb . S oz.

## 30. Allow white Flame.

I. Saltpetre 2 lb . brimftone 3 lb . antimony 1 lb .11 . Saltpetre $3 \frac{1}{2} \mathrm{lb}$. fulphur $2 \frac{1}{2} \mathrm{lb}$. meal-powder 1 lb . antimony $\frac{x}{2}$ lb. glafs-duft 4 oz. biafs-duft 1 oz.
N. B. Thefe compofitions, driven $1 \frac{1}{4}$ inch in a $10 z$. cafe, will burn one minute, which is much longer time than an equal quantity of any compofition yet known will laft.
31. Amber Lights.

Meal-powder 9 cz . amber $30 \%$ This charge may be drove in fmall cafes, for illuminations.
32. Lights of anotlocr Kind.

Saltpetre 3 lb . brimftone 1 lb . meal-powder i lb. antimony $10 \frac{\pi}{2} \mathrm{oz}$. All thefe mult be mixed with the oil of fpike.

> 33. A red fire.

Meal-powder 3 lb . charcoal 12 oz . and faw-dult 8 oz . 34. A common Fire.

Saltpetre 3 lb . charcoal 10 oz . and brimitone 2 oz . 35. To make an artificial Earthquake.

Mix the following ingredients to a pafte with water, ans then bury it in the ground, and in a few hours the
earth will break and open in feveral places. The compofition : fulphur 4 lb . and iteel-dult 4 lb .
36. Compoftions for Stars of different Colours.
I. Meal-powder 4 oz . faltpetre 2 oz . brimftone 2 oz . fteel-duft $1 \frac{1}{2}$ oz. and camphor, white amber, antimony, and mercury-fublimate, of each $\frac{2}{5}$. II. Rochepetre 10 oz . brimfone, charcoal, antimuny, mealpowder, and camphor, of each $\frac{3}{4} \mathrm{oz}$. moiltened with oil of turpentine. Thefe compofitions are made into ftars, by being worked to a pafte with aqua vitx, in which has been dilfolved fome gum-tragacantl ; and after you have rolled them in powder, make a hole through the middle of each, and Itring them on quickmatch, leaving about 2 inches between each. IIl. Saitpetre 8 oz . brimitone 2 oz . ycllow amber 1 oz , antimony 1 oz . and powder 3 oz . IV. Brimftone $2^{\frac{2}{2} \mathrm{cz}}$ faltpetre 6 oz . olibanum or frankincenfe in drops 4 oz. malick, and mercury-fublimate, of cath 4 oz . meal-powder 5 oz . white amber, yellow amber, and camphor, of each $10 z$. antimony and orpiment $\frac{5}{2}$ oz. each. V. Saltpetre 1 lb . brim? one $\frac{3}{2} \mathrm{lb}$. and mealpowder 8 oz . moi!tcned with petrolio-oil. VI. Powder $\frac{1}{2} \mathrm{lb}$. brimilone and faltpetre, of each 4 oz . VII. Saltpetre 4 oz . brimftone 2 oz . and meal-pouder 1 oz .

Stars that carry tails of farks. I. Brimftone 6 oz . antimony crude 2 oz . faltpetre + oz. and rofin 4 oz . II. Saltpetre, rofiu, and charcoal, of each 2 oz . brimfone 1 oz. and pitch I oz.

Thefe compofitions are fometimes melted in an earthen pan, and mixed with chopped cotton-match, before they are rolled into ftars; but will do as well if wetted, and worked up in the ufual manner.

Stars that yield fome farks. I. Camphor 2 oz. faltpetre 1 cz . meal-powder 1 oz . II, Saltpetre 1 oz . ditto melted $\frac{1}{2}$ oz. and camphor 2 oz . When you would make flars of either of thefe compofitions, you muf wet them with gum-water, or fpirit of wine, in which has been diffolved fome gum-arabic, or gumtragacanth, that the whole may have the confiltence of a pretty thick liquid; having thus done, take I oz. of lint, and fir it about in the compofition till it becomes dry enough to roll into ftars.

Stars of a yellowifs colour. Take 4 oz . of gumtragacanth or gum-arabic, pounded and fifted through a fine fieve, camphor diflolved in brandy 2 oz . faltpetre I lb . fulphur $\frac{1}{2} \mathrm{lb}$. coarle powder of glafs 4 oz . white amber $1 \frac{\mathrm{z}}{2} \mathrm{oz}$. orpiment 2 oz . Being well incorporated, make them into ftars after the common method.

Stars of another kind. Take 1 lb . of camplior, and melt it in a pint of fpirit of wine over a now fire; then add to it 1 lb . of gum-arabic that has been diffelved; with this liquor mix 1 lb . of faltpetre, 6 oz . of fulphur, and 5 oz . of meal-powder; and after you lave ftirred them well together, roll them into flars proportionable to the rockets for which you intend them.
37. Colours produced by the different Compofitions.

As variety of fires adds greatly to a collection of works, it is neceffary that every artift fhould know the different effect of each ingredient. For which reafon, we flall here explain the colours they produce of themfelves; and likewife how to make them retain the fame when mixed with other bodies: as for example,
dients fulphur give a blue, camphor a white or palc colour, firtyctre a clear white-yellow, amber a colvur inclining to yelow, fal:ummoniac a green, amtimony a reddilh, rofin a copper colour, and Greek-pitch a kind of bronzc, or between red and yellow. All thefe ingredients ane fuch as lhow themfelves in a flame, viz.

White flame. Saltpetre, fu!phur, meal-powier, and camphor; the faltpetre mult be the chief part.

B/ue fame. Meal-powder, faltpetre, and fulphur vivum; fulphur mult be the chief: Or meal-powder, faltpetre, brimftone, fpirit of wine, and oil of fpike; but let the powder be the principal part.

Flume inclining to red. Saltpetre, fulphur, antimony, and Greek-pitch ; faltpetre the clicf.

By the above mathod may be made various colours of fire, as the practitioner pleafes; for, by makiug a few trials, he may caufe any ingredient to be predominant in colour.
38. Ingredients that fonv in Sparks zwhen rammed in choaked Cales.
The fet colours of fire prodiced by fparks are divided into 4 forts, viz. the black, white, grey, and red. The black charges are compofed of 2 ingredients, which are meal powder and clarcoal ; the white of 3 , viz. faltpetre, fulphur, and charcoal; the grey of 4, viz. meal-powder, faltpetre, brimitone, and chareoal; and the red of 3 , viz. meal-powder, charcoal, and fawduft.

There are, belides thefe four regular or fet charges, two others, which are diftinguifhed by the names of compound and brilliant charges; the compound being made of many ingredients, fuch as meal-powder, faltpetre, brimfone, charcoal, faw.duft, fea-coal, antimony, glafs duft, brafs duft, feel filings, caft iron, tanner's duf, \&cc. or any thing that will yield farks; all which muft be managed with difcretion. The brilliant fires are compofed of meal-powder, faltpetre, brimfone, and fteel duft; or with meal-powder and fteel tilings on! $y$.

## 39. Cotton 2uick-match,

Is generally made of fuch cotton as is put in candles, of feveral fizes, from 1 to 6 threads thick, according to the pipe it is defigned for ; which pipe muft be large enough for the match, when made, to be puthed in eafily without breaking it. Having doubled the cotton into as many threads as you think droper, coil it very lightly into a flat-bottonied copper or earthen pan; then put in the faltpetre and the liquor, and boil them about 20 minutes; after which coil it again into another pan, as in fig. 4 . and ponr on it what liquor remains; then put in fome meal-powder, and prefs it down with your hands till it is quite wer ; afterwards place the pan before the wooden frame (fig. 5.) which malt be furfended by a point in the centre of each end; and place yourfelf before the pan, tying the upper end of the cotton to the end of one of the fides of the frame.

When every thing is ready, you mult have one to turn the frame round, while you let the cotton pafs through your hands, holding it very lightly, and at the fame time keeping your hands full of the wet powder; but if the powder thould be too wet to ftick to the cotton, put more in the pan, fo as to keep a continual fupply till the match is all wound up; ynu may wind it as clofe on the frame as you pleafe, fo that
it do not flick together; when the frame is full, of Woulds take it off the points, and fift dry meal-ghowder on Cafes, vixboth fides the match, till it appear quite dry: in win- ${ }^{\text {sure, in }}$ muter the match will be a fortnight before it is fit for $\underbrace{\text { menes, \& }}$, ufe; when it is thoroughly dry, cut it along the outfide of one of the dides of the frame, and tic it up in fkins for ufe.
N. B. The match mult be wound tight on the frames.

The ingredicsts for the match, are, cotton 1 lb .12 o7. falperre 1 lb . fpirits of wine 2 quarts, water 3 quarts. ifinglafs 3 gills, and meal-powder 10 lb . To diffolve 4 oz . of iinglafs, take 3 pints of water.
2d 39. Touch-paper for capping of Serpents, Crackers, \&c.
Diffolve, in ipirits of wine or vinegar, a little faltpetre; then take fome purple or blue paper, and wet it with this liquor, and when dry it will be fit for ufc; when you paite this paper on any of your works, take care that the pafte does not touch that part which is to burn. The method of ufing this paper is by cutting it into lips, long enough to go once round the mouth of a ferpent, cracker, \&c. When you palte on thefe flips, leave a little above the mouth of the care not pafted; then prime the cafe with meal-powder, and twift the paper to a point.

Sect. II. Of Moulds, Cafes, Mixture, Inftruments, ધُi。

## 40. Rockit moulds.

As the performance of rockets depends much on their moulds, it is requifite to give a definition of them and their proportions: They are made and proportioned by the diameters of their orifice, which are divided into $=$ parts. Fig. 6. reprefents a mould made by its diameter AB : its height from C to D is 6 diameters and 2 thirds; from $D$ to $E$ is the height of the foot, which is 1 diameter and 2 thirds; $F$ the choak or cylinder, whofe height is 1 diameter and $1-3$ d; it muft be made out of the fame piece as the font, and fit tight in the mould; $G$ aniron pin that goes through the cylinder to keep the foot faft; $H$ the nipple, which is $\frac{2}{2}$ a diameter high, and $2-3$ ds thick, and of the fame piece of metal as the former I, whofe height is $3 \div$ diameters, and at the bottom is $1-3 \mathrm{~d}$ of the diameter thick, and from thence tapering to 1 - 6 th of the diameter. The beft way to fix the piercer in the cylinder is to make that part below the nipple long enough to go quite through the foot, and rivet at bottom. Fig. 7. is a former or roller for the cafes, whofe length from the handle is $7 \frac{1}{9}$ diameters, and its diameter $2-3$ ds of the bore. Fig. 8. the end of the former, which is of the fame thicknefs, and ! diameter and 2-3ds long ; the fmall part, which fits into the hole in the end of the roller when the cafe is pinching, is $1.6 \mathrm{t}_{2}$ and $\frac{1}{3}$ of the mould's diameter thick. Fig. 9. the firft drift, which muft be 6 di:meters from the handle ; and this, as well as all other rammers, mult be a little thinner than the former, to prevent the facking of the paper when you are driving in the charge. In the end of this rammer is a hole to fit over the piercer: the line $K$ marked on this is 2 diameters and $1-3 \mathrm{~d}$ from the handle; fo that, when you are filling the rocket, this line appears at top of the cafe: you muft then take the 2 d rammer (fig. 10.) which from the handle is 4
diameters,
of Mou'de, diameters, and the hole for the piercer is $i \frac{x}{2}$ diameter Cales, Mix- long. Fig. It. is the fhort and fulid drift which you cure, Intru- ufe when you have filled the cafe as high as the top of mente, \&c. the piercer.

Rammers muft have a collar of brafs at the bottons, to keep the wood from foreading or fplitting, and the fame proportion mutt be given to all moulds, from : nz. to 6 lb . We mentioned nothing concerning the handles of the rammers; however, if their diameter be equal to the bore of the mould, and 2 diameters long, it will be a very good proportion: but the fhorter you ean ube them, the better; for the longer the drift, the lefs will be the preffure on the compofition by the blow given with the mallet.

## Dimenfions for Rocket Moulds, if the Rockets are rammel folid.

Weight Length of the Interior diameter Height of of rock- rnouldswithout of the moulds. the nipples.

The diameter of the nipple muft always be equal to that of the former.

The thicknef's of the moulds is omitted, being very immaterial, provided they are fubftantial and Arong.

Our רuthor advifes thofe who make roekets for frivate amufement, not to ram them folid; for it requires a very $k$ kilful hand, and an expenfive apparatus for boring them, which will be thown hereafter. Driving of rockets folid is the molt expeditious method, but not fo certain as ramming them over a piercer.
41. Moulds for Wheel-cafes or Serpents.

Fig. 12. reprefents a monld, in which the cafes are drove folid ; $L$ the nipple ( $A$ ), with a point ( $\overline{\text { ) }}$ at top, which, when the cafe is filling, ferves to fop the neck, and prevent the compofition from falling out, which without this point it would do; and, in confequence, the air would get into the vacancy in the charge, and at the time of firing caufe the cafe to burft. Thefe fort of moulds are made of any length or diameter, according as the cafes are required; but the diameter of the rollers mult be equal to balf the borc, and the rammers made quite follid.
42. To roll Rocket and oilher Cafes.

Sky-rocket cafes are to be made $6 \frac{1}{2}$ of their extesior diameter long; and all other cafes that are to be
filled in moulds muft be as long as the moulds, within half its interior diameter.
Rocket cafes, from the fmalleft to 4 or 6 lb . are generally made of the ftrongeft fort of cartridge paper, and rolled dry; but the large fort are made of pafted paftecoard. As it is very difficult to roll the ends of the cafes quite even, the beft way will be to keep a pattern of the paper for the different forts of cafes; which pattern fiould be fomewhat longer than the cafe it is defigned for, and on it marked the number of theets required, which will prevent any paper being cut to walte. H.ving cut your papers of a proper fize, and the lait theet for each cafe with a flope at one end, fo that when the cafes are rolled it may form a fuiral line round the outfide, and that this flope may always be the fame, let the pattern be fo cut for a guide. Before you begin to roll, fold down one end of the firft theet, fo far that the fold will go 2 or 3 times round the former: then, on the double edge, lay the former with its handle of the table; and when you have rolled on the paper within 2 or 3 turns, lay the next fheet on that part which is loofe, and roll it all on.
Having thus done, you mult have a fmooth board, about 20 inches long, and equal in breadth to the length of the cafe. In the middle of this board mult be a handle placed lengthwife. Under this board lay your cafe, and let one end of the board lie on the table; then prefs hard on it, and pufh it forwards, which will roll the paper very tight: do this three or four times before you roll on any more paper. This muft be repeaied every other fheet of paper, till the cafe is thick enough ; but if the rolling board be drawn backwards, it will locien the paper: you are to obferve, when you roll on the laft fheet, that the point of the flope be placed at the fimall end of the roller. Having rolled your cafe to fit the mould, puif in the fmall end of the former F , about I diameter from the end of the cafe, and put in the end-piece within a little diftance of the former; then give the pinching cord one turn round the cafe, between the former and the end-piece; at firft pull eafy, and keep moving the cafe, which will make the neek fmonth, and without large wrinkles. When the cafes are hard to choak, let each fheet of paper (except the firft and laft, in that part where the neck is formed) be a little moiftened with water: immediately after you have fruck the concave ftroke, bind the neck of the cafe round with frall twine, which mult not be tied in a knot, but faftered with two or three hitches.

Having thus pinched and tied the cafe fo as not to give way, put it into the mould without its foot, and with a mallet drive the former hard on the end-piece, which will force the neck clofe and fmooth, This done, cut the cafe to its proper length, allowing from the neck to the edge of the mouth half a diameter, which is equal to the height of the nipple; then take out the former, and drive the cafe over the piercer with the long rammer, and the vent will be of a proper fize. Wheel-cafes mult be drove on a nipple with a point to clofe
(A) The nipple and cylinders to bear the fame proportion as thofe for rockets.
(B) A round bit of brafs, equal in length to the neck of the cafe, and flat at the top.
cMoulds, clofe the neck, and make the vent of the fize required; cos, Alix- which, in mon caics, is renctally $\frac{\text { q }}{}$ of their interior diameter. As it ịs very often difficult, when the cafes are rolled, to draw the roller out, you may make a hole through the handle, and put in it a fmall iron pin, by which you may eafly turn the former round and pull it out, $\mathrm{Fig}, 17$. flows the method of pinching cafes; P a treddle, which, when preffed hard with the foot, will draw the cord tight, and force the nock as clofe as you plealic ; $Q$ a fmall whecl or pully, with a groove round it for the cord to run in.

Cafes are commonly rolled wct, for wheels and fixed pieces; and when they are required to contain a great length of charge, the method of making thofe cafes is thus: Your piper mult be cut as ufual, only the lat fhect nutt not be cut with a flope: laving your paper ready, pafte each theet on one fide; then told down the firft fheet as before direfed: but be careful that the pafte do not tnuch the upper past of the fold; for if the roller be wetted, it will tear the paper in drawing it out. In pafting the laft fheet, obferve not to wet the laft turn or two in that part where it is to be pinched ; for if that part be damp, the pinching cord will ftick to it, and tear the paper; therefore, when you choak thofe cafes, roll a bit of dry paper once round the cale, before you put $\in$ n the pinching cord ; but this bit of paper muft be taken off after the cale is chnaked. The rolling board, and all other methods, according to the former direations for the rolling and pinching of cafes, mult be ufed to thefe as well as all other cafes.

## 43: To make Tourvillan Cafis.

Thofe fort of cafes are generally made about 8 diameters long; but if very large, 7 . will be fufficient: tourbillons will an:wer vcry well from 4 oz . to 2 lb . but when larger there is no certainty. The cafes are beft rolled wet with palte, and the laft fheet muit have a fraight edge, fo that the cafe may be all of a thicknefs: when you have rolled your cafcs after the raanner of wheel-cales, pinch them at one end quite clofe ; then with the rammer drive the ends down flat, and afterwards ram in about $1-3 \mathrm{~d}$ of a diameter of dried clas. The diameter of the former for thele cafes mult be tise fame as for ik j -rockets.
N. B. Tourbillons are to be rammed in moulds without a ripp!e, or in a mould withour its foot.
44. Bitlion Cufis or Papcr Sbolls.

Firf, you muit have an oval former turned of fmooth wood; then pafte a quantity of brown or cartridge paper, and lit it lie till the pafte has quite foaked th:ough ; this done, rub the former with foap or greafe, to prevent the paper from Aticking to it; then lay the paper on in fmall flips, till you have made it $1-3 \mathrm{~d}$ of the thicknefs of the fhell intended. Having thas due, fet it to dry ; and when dry, cut it round the middle, and the two halves will eafly come off : but obferve, when you cut, to leave about 1 inch not cut, which will make the halves join much better than if quite feparated. When you have fome ready to join, place th:e valves even together, patte a flip of paper round the opening to hold them together, and let that dry; then lay on paper all over as before, everywhere equal, execpting that end which goes dnwnwards in the mortar which may be a little thicker than the reft ; for that part which receives the blow from the
powder in the chamber of the mortar confequently re- Di Vould, quires the greitelt lircngth. When the thell is tharourgh. (ares, Ahrly dry, burn a round vent at top, with fguare iron, laredrefr large enough for the luze: this methed will do for bal. mers. 8 loons from + inches $2 \cdot 5$ thes, to 8 inches diometer; but if they are larger, or required to be thrown a great height, It the firt fhell be turned of clm, infteall of being made of paper.

For a balloon of + irches 2 -5ths, let the former l:e 3 inches I-Sth diameter, and $5 \frac{2}{5}$ inches long. For a ballon of $5^{5}$ inches, the dimeter of the former mont be 4 inches, and $S$ inclies long. For a ballon of 8 incics, let the diameter of the former be 5 inches and 15.1 othe, and 11 inches 7 -8ths long. For a 10 -inch balioon, let the former be 7 inches $3-16$ ths diameter, and $14^{\frac{1}{5}}$ inches long. The thicknets of a thell for a balloon of + inchics 2.5 ths, mutt be $\frac{x}{2}$ inch. For a balloon of $5^{\frac{1}{3}}$ inches, let the thicknels of the paper be $5-8$ ths of an inch. For an 8 -inch balloon, 7 - 8 ths of an inch. And for a 10 -inch balloon, let the fhell be 1 inch 1 -Sth thick.

Shells that are defigned for flars only, may be made quite round, and the thimer they are at the opening, the better; for if they are too ftrong, the ftars are apt to break at the burling of the fhell: when you are making the facll, make ufe of a pair of calibres, or a round gage, fo that you may not lay the paper thicker in one place than another; and alfo to know when the fhell is of a proper thicknefs. Balloons mult always be made to go ealy into the mortars.

Cafes for illuminations Port-fires. Thefe mult be made very thin of puper, and rolled on formers, from 2 to 5. Sths of an inch diameter, and from 2106 inches long: they are pinched clofe at one end, and left open at the other. When you fill them, put in but a little compofition at a time, and ram it in lighty, fo as not to break the cafe: 3 or $A$ rounds of paper, with the laft round gafted, will be Atrong enough for thefe cafcs.

Cafes and msulds for common Port-fires. Common portfires are intended purpofely to fire the works, their fire being very $\mathrm{fl}, \mathrm{w}$, and the heat of the flame fo intenfe, that, if applied to rockets, leaders, \&c. It will fire them immediately. Port-fires may be made of any iength, but are feldom made more than 21 inches long: the interior diameter of port-fire moulds fhould be 10-16 ths of an inch, and the diameter of the former $\frac{x}{\frac{1}{2}}$ an inch. The caics mult be rolled wet with pate, and one er.d pinched, or folded down. The moulds frould be made of brafs, and in take in two pieces lengthwite; when the cate is in the two fides, they are held together by brafs rings, or hoops, which are made to fit over the outfide. The bore of the mould mult not be made quite through, fo that there will be no occafion for a foot. Thofe port-fires, when ufed, are held in onpper fockets, fixed on the end of a long fick: thefe fockets are made like port-crayons, only with a fceew inftead of a ring.
45. Of miving the Comptititions.

The performance of the principal part of fire works depends much on the compofition, being well mixed; therefore great carc mult be taken in this part of the work, particularly for the compofition for ky -rockets. When you have 4 or 5 pounds of ingredients to mix, which is a fufficient quantity at a time (for a larger propertion
()Anohe, preponion will not do fo well), firft put the different rafeg, Mix tare, laftrio
 ingredients ingether; then work them about with your hands, till you think they are pretty well incorporated: after which put them into a lawn fieve wilh a receiver and top to it ; and if, after it is fifted, any remains that will nit fafs throublh the fieve, grind it again till fine enough ; and if it be twice fifted, it will not be amifs; D,ut the compofitions for wheels and common works are not fo material, nor need be fo fine. But in all tixed works, from which the fire is to play regular, the ingredients mult te very fine, and great care taken in mixing them weli together; and obferve, that in all comporitions wherein are fteel or iron filings, the hands muft net touch; nor will any works which have irom or fleel in their charge keep long in damp weather, unlefs properly prepared, according to the following dilations.

## 46. To preferve Stecl or Iran fings.

It fometimes may lappen, that fire works may be required to be kept a long time, or fent abroad; neither of which could be done with brilliant fires, if made with filings unprepared; for this reafon, that the falteptre being of a damp nature, it caufes the iren to uit; the confequence of which is, that when the ronks ate fired, there will appear but very few brilliant fiparks, but inflead of them a number of red and drofy fparks; and befides, the charge will be fo muci weakened, that if this was to happen to wheels, the fire will hardly be ftrong enough to force them sound. But to prevent fuch accidents, prepare your filings thus: Melt in a glazed earthen pan fomc brimftone over a flow fire, and when melted throw in fome flings; which keep llirrirg about till they are covered with brimftone: this you muft do while it is on the fire; then take it off, and ftir in very quick till cold, when you muft roll it on a board with a wooden roller, tiil you have broke it as fine as corn powder; after which fift from it as much cf the brimftone as you can. There is another method of preparing filings, fo as to keep 2 or 3 months in winter; this may be done by rubbing them between the ftrongeft fort of brown paper, which before has been moiftened with lintreed oil.
N. B. If the brimftone fhould take fire, you may put it out, by covering the pan clofe at top: it is not of much fignification what quantity of brimftone you ufe, fo that there is enough to give each grain of iron a coat; but as much as will cover the bottorn of a pan of about 1 foct diameter, will do for 5 or 6 pound of filings, or caft-iron for gerbes.
47. To drive or ram Sky rockets, \&c.

Rockets drove over a piercer mult not have fo mush compofition put in them at a time as when drove folid; for the piercer, taking up great part of the bore of the cafe, would caufe the rammer to rife too high; fo that the preffure of it would not be fo great on the compofition, nor would it be drove everywhere equal. To prevent this, obferve the following rule : That for thofe rockets which are rammed over a piercer, let the ladle (c) hold as much compofi-
tion as, when drove, will raife the drift ; the intenior Of Mould diameter of the cafe, and for thofe drove folid to con- Cafe, Mi tain as much as will raife it : the exterior diametcr of ture,tnfrt the cafe: ladles are generally made to go eafy in the menes, \& cafe, and the length of the foop about $1:$ of its own diameter.
The change of rockets mult always be drove I diameter above the pierser, and on it muft be rammed 1-3d of a diameter of clay; through the middle of which bore a fmail hole to the compofition, that, when the charge is burnt to the top, it may communicate its fire, through the hole, to the fars in the head. Great care muft be taken to lrike with the mallet, and with an equal force, the fame number of frokes to each ladlefull of charge; otherwife the rockets will not rife with an uniform motion, nor will the compofition burn equal and regular: for which rcafon they cannot carry a proper tail; for it will break before the rocket has got half way up, inftead of reaching from the ground to the top, where the rocket breaks and diiperfes the fars, rains, or whatever is contained in the head. When you are ramming, keep the drift conflantly turning or moving ; and when you ufe the hollow rammers, knock out of them the compofition now and then, or the piercer will fplit them. To a rocket of 4 oz . give to each ladle-full of charge 16 thokes; to a rocket of 1 lb . 28 ; to a 2 -pounder, 36 ; to a 4 pounder, 42 ; and to a 6 .pounder, 56 : but rockets of a larger fort cannot be drove well by hand, but muft be rammed with a machine made in the fame manner as thofe for driving piles.

The method of ramming of wheel-cafes, or any other fert, in which the charge is dreve folid, is much the fame as iky-rockets; for the fame proportion may be obferved in the ladle, and the fame number of frokes given, arcording to their diameters, all cafes being diitinguifhed by their diameters. In this manner, a cafe, whofe bore is equal to a rocket of 4 oz . is called a 4 -oz. cafe, and that which is equal to an 8 -oz. rocket an 8 -oz. cafe, and fo on, according to the different rockets.

Having taught the method of ramming cafes in moulds, we fhall here fay fomething concerning thoie filled without moulds; which method, for ftrong pafted cafes, will do cxtremely well, and fave the expence of making fo many moulds. The reader mult here obferve, when he fills any fort of cafes, to place the mould on a perpendicular block of wood, and not on any place that is hollow; for we have found by experience, that when cafes were rammed on driving benches, which were formerly ufed, the works frequently mifcarried, on account of the hollow refiftance of the benches, which oft jarred and loofened the charge in the cafes; but this accident never happens when the driving blocks are ufed (D).

When caies are to be filled without monlds, pro. ceed thus. Have fome nipples made of brafs or iron, of feveral forts and fizes, in proportion to the cafes, and to fcrew or fix in the top of the driving block; when you have fixed in a nipple, make, at about s? inch
(c) A copper fcoop with a wooden handle.
(D) A piece of lard wood in the form of an anvil block.

Whoulds, inch from it, a fquatc hole in the block, 6 inches deep es, Mix- and 1 inch diameter; then hawe a piece of wood, 6 inch. I, Influaits, \&c. es longer than the cafe intended to befilled, and 2 inches fquare; on one fide of it cut a groove almolt the length of the cafe, whole breadth and depth mutt be finflitient to cover near ; the cafe; then cut the other end to fit the hole in the block, but take care to cut it fo that the groove may be of a proper diftance from the nipple ; this half mould being made and fived tight in the block, cut, in another piece of wond nearly of the fame length as the cale, a groove of the fime dimentions as that in the fixed piece; then put the care on the nipple, and with a cord tie it and the 2 half-moulds together, and your cafe will be ready for filling.

The dimenfions of the above-deferibed half-moulds are proportionable for cales of 8 ounces; but notice muft be taken, that they difler in lize in proportion to the cales.

Note, The clay, mentioned in this article, muft be prepared after this manner: (ret fonce clay, in which there is no flones nor find, and bake it in an oven till quite dry; then take it out and beat it to a powder, and afterwards fift it through a common hair-fieve, and it will be fit for $u$ fe.

> 4. Proportion of Mallets.

The bell wond for mallets is dry beech. If a perfon nfes a mallet of a moderate lize, in proportion to the rocket, according to his judgment, and if the rocket fucceeds, he may depend on the reft, by ufing the fame mallet ; yet it will be neceftary that cafes of different forts be drove with mallets of different fizes.

The following proportion of the mallets for rockets of any fize, from 1 oz . to 6 lb . may be obferved; but as rockets are feldom made lefs than 1 oz. or larger than 6 lb . we thall leave the management of them in the curious; but all cafes under i oz. may be rammed with an cz. rocket mallet. Your mallets will frike more folid, by having their handles turned out of the fame piece as the head, and made in a cylindrical form. Let their dimenfions be worked by the diameters of the rockets: for example ; let the thicknefs of the head be 3 diameters, and its length 4 , and the length of the handle 5 diameters, whote thickness muft be in propor. tion to the hand.
49. Proportion of Sky-rockets, and manner of beading them.
Fig. 13. reprefents a rocket complete without its fick, whole length from the neck is 5 diameters $1-6$ th : the cafes fhould always be cut to this length after they are filled. $M$ is the head, which is 2 diameters high, and 1 diameter $1-6$ th $\frac{\gamma}{2}$ in brealth ; $N$ the cone or eap, whofe perpendicular height muft be 1 diameter $1-3 \mathrm{~d}$. Fig. 14. the collar to which the head is fixed: this is turned out of deal or any light wood, and its exterior diameter muft be equal to the interior diameter of the head; 1-6th will be fufficient for its thicknefs, and round the outfide edge muft be a groove; the interior diameter of the collar mult not be quite fo wide as the exterior diameter of the rocket; when this is to be glued on the rocket, you mult cut two or threc rounds of paper off the cafe, which will make a thoulder for it to reft upon. Fig. 15. a former for the head : two or three rounds of paper well palted will be enough for the head, which, when rolled, put the collar on that pirt of the former marked $O$, which roult fit the infide of

## E C H N H .

it; then, with the pinching cord pinch the briown of (if Mouls., the head into the groove, and tie it with fmall twioc. Cufes, Blive Iig. I6. a former for the cone. To make the caps, twe.talriscut your paper in round pieces, equal in diameter :0 biciats, \&ic. twice the length of the cone you intend to make ; which pieces being cut into halves, will make two caps cacl;, without walling any paper; having formed the cars, pafie over each of them in thin white paper, which muit be a littic longer than the cone, fo as to project about $\frac{2}{2}$ an inch bclow the bottom: tl is projection of paper, being notched and pafted, ferses to fatten the cap to the head.

When you load the heads of your rockets, with ftars, rains, ferpents, crackers, ferolls, or any thing elfe, according to your fancy, remember always to put a ladicfull of meal-powder into each head, which will be enought to burft the head, and difperie the fars, or whatever it contans: when the heads are loaded with any fort of cafes, let their mouths be placed downwards; and after the heads are filled, palle on the top of them a piece of paper, beforc you put on the caps. As the lize of the ftars often differ, it would be nceulefs to give an exact number for each rocket; but this rule may be obferved, that the heads may be ncarly filled with whitiever they are loaded.

5=. Decorations for Sky-rockets.
Sky-rockets beaning the pre-eminence of all fireworks, it will not be improper to treat of their various kinds of decorations, which are directed according to fancy, Some are headed with fars of different forts, fuch as tailed, brilliant, white, blue, and yellow ftars, \&c.; fome with gold and filver rain; others with ferpent; crackers, firefcrolls, marrons; and fome with fmall rockets, and many other devices, as the make: pleales.

## Dimenfions and poife of Rocket-ficks.

| Weight of the rocket. | Length of the fick. | Thicknefs at top. | Breadth at top. | Square at bottam. | loife from the point of the cunc. |
| :---: | :---: | :---: | :---: | :---: | :---: |
| L. oz. | F. in. | Inches. | Inches. | Inches. | F. in. |
| 6 - | 140 | 1,5 | 1,85 | 0,75 | 4 1,5 |
| 40 | 1210 | 1,25 | 1,40 | 0,625 | 3 92 |
| 20 | 94 | 1,125 | I, | c,525 | 2 9, |
| 10 | 82 | 0,725 | 0,80 | 0,375 | 2 I, |
| 8 | 66 | 0,5 | 0,70 | 0,25 | 110,5 |
|  | 53 | 0,3750 | 0,55 | 0,35 | 18,5 |
| 2 | 41 | 0,3 | 0,45 | 0,15 | 13 , |
| 1 | 36 | 0,25 | 0,35 | 0,10 | 180 , |
| : | 24 | 0,125 | 0,20 | 0,16 | 8 0, |
| 4 | $10^{\frac{1}{2}}$ | C, 1 | 0,15 | 0,5 | $5 \quad 0,5$ |

The laft column on the right, in the ahove table, expreffes the difance from the top of the cone, where the fick, when tied on, fhould balance the rocket, fo as to fand in an equilibrium on one's finger or the edge of a knife. The beft wood for the ficks is dry deal, made thus. When you have cut and planed the fticks according to the dimenfions given in the table, cut, on one of the flat fides at the top, a groove the length of the rocket, and as broad its the ftick will allow; then, on the oppofite flat fide, cut two notches for the corsi, which ties on the rocket, to lie in; one of thefe notches muft be near the top of the ltick,

Of Moulls, and the oher facing the neck of the rockets; the tafe, Wix- diftarce bewecn thefe notches may eafily be known, ture, Intruv for the top of the ltick fhoull alwass touch the heat ments sic, of the rocket. When your rockets and ficks are rady, lay the rockets in the grooves in the ficks, and tie them cm . Thofe who, merely for curiolity, may chorfe to make roclitets of different fizes, from thofe exprefied in the table of dimenlions, may find the length of their flichs, by making them for rockets, from $\frac{1}{3}$ oz. to i 1 lb . 60 diameters of the rocket long; and for rockets above 1 lb . 50 or 52 diameters will be a good length; their thicknefs at top may be about $\pm$ a diameter, and their beadh a vory little more; Wheir fquare at botom is generally equal t ) $\frac{7}{3}$ the thicknefs at inp. But although the dimenfions of the fticks be very nicely obferved, you mult depend only on their balance; for, without a proper comaterpoife, your rockets, inllcad of mounting perpendicu'arly, will take an oblique direation, and fall to the ground before they are burnt out.

## 51. Boring Rockets autith lave been driven foil.

Fig. 18. reprefents the plan of an apparatus, or lathe, for boring of rockets. A the large whecl, whi h turns the fnall no $\mathcal{D}$, that works the rammer C: thefe rammers are of different fizes according to the rockets; they mult be of the fame diameter as the t P of the bore intended, and continue that thicknels a litte lorger than the depth of the bore required, and their points muft be like that of an augre : the thick end of each rammer mult be made fquare, and all of the fame fize, fo as to fit into one focket, wherein they are faftened by a forew D. E the guide for the rammer, which is made to move backwards and forwards: fo that, after you have marked the rammer $3 \frac{1}{2}$ diameters of the rocket from the point, fet the guide, allowing for the thichnefs of the fronts of the rocket boxes, and the neck and mouth of the rocket; fo that when the front of the large box is clofe to the guide, the rammer may not go too far up the charge. F, boxes for holding the rockets, which are made fo as to fit in one another; their fides mult be equal in thicknefs to the differeace of the diame. ters of the rockets, and their interior diameters equal to the exterior diameters of the rockets. To prevent the rockets turning round while boring, a piece of wood mult be placed againt the end of the box in the in. fide, and preffied againgt the tail of the rocket; this will alfo hinder the rammer from forcing the rocket backwards. G, a rocket in the box. H, a box that flides under the rocket-hoses to receive the borings for the rockets, which fall through holes made on purpofe in the boxes; thefe holes muft be juft under the mouth of the rocket, one in each bor, and all to correfpond with each other.

Fig. 19. is a front view of the large rocket-box. I, an iron plate, in which ate hoies of different fizes, through which the ranmer pafes: this plate is faftened with a ferew in the centre, fo that when you change the rammer, you turn the plate round, but always lct the hole you are going to ufe be at the bottom: the fronts of the other boxes muft have holes in them to correfpond with thofe in the plate. K, the lower part of the large box; which is made to fit the inflide of the lathe, that all the boxes may move quite fleady.

Fig. 20. is a porfective view of the lathe. I., the of Mot guide for the rammer, which is fet by the feresw at bottom.

Fig. 21. A view of the front of the guide facing the rammer. MI, an iron plate, of the iame dimeations as that on the front of the box, and placed in the fanme dirention, and alfo to turn on a frew in the centre. N , the rocke-box which flides backwards and forwards: when you have fixed a rocket in the box, puth it forwards againft the rammer; and when you think the fooop of the rammer is full, ditaw the bos back, and knock out the empofition: this yon mult do till the rocket is bored, or it will be in danger of taking fire; and if you bore in a hurry, wet the end of the rammer now and then with oil to keep it conl.
H.wing bored a number of reckets, you muf have taps of different forts according to the rockicts. Thefe taps are a little longer than the bore: but when you ufe them, mark them $3 \div$ diameters from the print, allowing for the thicknelis of the rocket's neck; then, holding the rocket in one hand, you tap it with the other. Onc of thefe taps is reprefented by tig. 22. They are made in the fime proportion as the fixed piercers, and are hollowed their whole length.
52. Hand Mackine ufod for boring of Rock:ts infteal of a Lathe.
Thefe fort of machines anfwer very well, though not fo expeditious as the lathes. But they are not fo expenfive to make, and they may be worked by one man; whereas' the lathe will require thee. Fig. 23. reprefents the machine. O, the rocket boxes, which are to be fixed, and not to flide as thofe in the lathe. PQ are guides for the rammers, that are made to flide together, as the rammer moves forward : the rammers for thefe forts of machines muft be made of a proper length, allowing for the thicknefs of the front of the boxes, and the length of the mouth and neck of the cafe; on the fquare end of thefe rammers mult be a round fhoulder of iron, to turn againft the outlide of the guide Q , by which means the guides are forced forwards. R, the flock which tums the rammer, and while turning muft be preffed towards the rocket by the body of the man who works it ; all the rammers are to be made to fit one fock.

## To make large Gerles.

Fig. 1. reprefents a wooden former; fig. 2. a gerbe complete, with its foot or fland. The cafes for gerbes are made very flrong, on account of the ftrength of the compofition; which, when fired, comes out with great velocity : therefore, to prevent their burfing, the paper fhould be patted, and the cafes made as thick at the top as at the bottom. They fhould alfo have very long necks, for this reafon; firf, that the particles of iron will have more time to be heated, by mecting with greater refiftance in getting out, than with a fhort neck, which would be burnt too wide before the charge be confumed, and fpoil the effect: fecondly, that with long necks the fars will be thrown to a great height, and will not fall before they are fpent, or fpread too much; but, when made to perfection, will rife and fipread in fuch a manner as to form exactly a wheat-lheaf.

In the raniming of gerbes, there will be no need of a mould, the cafes being fufficiently Arong to fupport themfelves,

Moulds，themfives．bi．t gou are to be carc＇ul，before you be－ （es，Mtix gin to ram，to have a piece of wood made to fit in the $\therefore$ ，t：－neck：for if $t$ ！．is be nut done，the compoftion will tamerts，fall inow the neck，and lewe a vacancy in the cafe， which will caule the cafe to bult fo foon as the fire arrives att the vacancy．Ioumult likewife obferve， that the firl liadle of charge，or fecond，if you think proner，be ef fome weal：compoftion．Whan the cale is tilled，take out the piece of wood，and fill the nock with fome fluw charge．Gerbes are gencrally made about 6 dameters long，from the bottom to the top of the neck；their bore mut be $1-5$ th narrower at top than at bottom．The neck $S$ is 1 －Gth diameter and $\frac{3}{4}$ long．＇ I ＇，a wooden foot or fand，on which the geabe is fixed．This may be made with a choak or cylinder 4 or 5 inches long to fit the infide of the care，or with a hole in it to put in the gabe；both there meihods vill anfwer the fame．Gerbes produce a mof bril－ liant fire，and are very beatilul when a number of them are fixed in the front of a building or a collection of fireworks．

N．D．Gerbes are made by their diameters，and their cafes at bottom $\frac{x}{4}$ thick．The method of finding the interior diameter of a gesbc is thus：Suppofing you would have the exterior diameter of the cafe，when made， to be 5 inches，then，by taxing $2-4$ hhs for the lides of the cafe，there will remain $2 \frac{5}{2}$ inches for the bore，which will be avery good fize．Thefe fort of gerbes fhould be rammed very bard．

$$
5+\text { Snall Gerth, or white Potntcins, }
$$

May be made of $4 \mathrm{cz} .80 \%$ or i lb．cures，pafted and made very frong，of what length you pleaie：but， before you fill them，drive in clay one diameter of their orifice high；and when you have filled a cafe，bore a vent through the centre of the clay to the com－ pefition：the common proportion will do for the vent， which muft be primed with a flow charge．There fort of cafes，without the clay，may be filled with Chi－ nefe fire．

## 55．To noke Paffloard and Paper Mortars．

Hate Fig．3．reprefents a former，and lig．4．an elm foot， cccxilx．for the mortar．Tig 5．reprefents a mertar complete： thefe mortars are beft when made with palteboard，well pafted before you begin；or inftead of palte，you may ufe glue．For a coehorn mortar，which is 4 in－ ches $2-5$ ths diameter，roll the pafteboard on the former i－6th of its diameter thick；and，when ary，cut one end fnooth and even ；then rail and glue it on the up－ per part of the font：when done，cut of the pafte－ hoard at top，allowing for the length of the mortar $2 \frac{5}{2}$ diamsters from the mouth of the powder－chamber； the：bind the mortar round with a frong cord wetted with chlue．U，the bottom part of the foot I diame－ ter $2-3 d s$ broad，and s diameter high；and that part whicl groes into the mortar is $2-3$ ds of its diameter ligh．W，is a copper chamber fir powder，made in a conical form ；and is $1-3$ d of the diameter wide， $\mathrm{T} \frac{\mathrm{x}}{\frac{1}{2}}$ of its own diameter long．In the centre of the bot－ tom of this chamber，make a fmall bole a little way down the foot；this hole mut be met by another of the fame fize，made in the fide of the foot，as is fhown in the figure．If thefe lobles are made true，and a cop－ per fipe bitted into beth，the mortar wher loaded will prime itfelf；for the powder will naturally fall to the bottom of the fieft hole；then by putting a bit of Vol．XV．

Powder for the mortar
$\begin{array}{ll}3 & 0 \\ 3 & 2\end{array}$
Leng h of the fuze compofition inch ${ }^{13}{ }^{\circ}$ muft be laded with 2 ounce cafes, drove with thar conipofition $\frac{1}{4}$ th of an inch, and on that 1 diameter of gold fire, then bounced 3 diameters; or with 2 ounce calies firt filled I diameter with gold fire, rhen $\frac{1}{4}$ th of an inch with ftar compolition, and on that $I \frac{1}{4}$ th diameter of brilliant fire. Thefe cafes muft be well lecured at top of the charge, left they fhould take fire at both ends: but their necks mutt be larger than the common proportion.

## 57. To make Balloon Fuzes.

Fuzes for air-balloons are fometimes turned out of dry beech, with a cup at top to hold the quick-match, as you fee in fig. 5. but if made with palted paper, they will do as well: the diameter of the former for fuzes for coehorn balloons mult be $\frac{1}{2}$ an inch; for a royal fuze, $\frac{5}{8}$ this of an inch ; for an 8 -inch fuze, $\frac{3}{4}$ ths of an inch; and for a 10 -inch fuze, $\frac{y}{8}$ ths of an inch. Having rolled your cafes, pinch and tie them almolt clofe at one end; then drive them down, and let then dry. Before you begin to fill them, mark on the outfide of the cafe the length of the charge required, allowing for the thicknefs of the bottom; and when you have rammed in the compofition, take two pieces of quich match about 6 inches long, and lay one end of each on the charge, and then a little meal powder, which ram down hard; the loofe ends of the match donble up inso the top of the fuze, and cover ir with ia paper cap to keep it dry. When you put the fhells in the matars, uncap the fuzes, and pull out the loote ends on the match, and let them hang on the lides of the balloons. The ufe of the match is, to receive the fire from the powder in the chamber of the mortar, in order to light the fuze: the fhell being put in the motar with she fuze uppermont, and exactly in the centre, fprinkle nver it a little meal-powder, and it will be ready to be fired.

Fuzes

Fuzes made of wood mult be longer than thofe of paper, and mot bored quite through, but left folid about $\frac{1}{2}$ an inch at botom; and when you wfe them, faw them off to a proper length, meafuring the charge from the cup at top.

## 58. Tourtillons.

Having filled fome cafes within about $\frac{1}{2}$ diameter, dive in a ladleful of clay; then pinch their ends clofe, and drive them down witha mallet. When done, find the centre of gravity of each cafe; where you nail and tie at Aick, which thould be $\frac{1}{2}$ an inch broad at the middle, and run a litile narrower to the ends: thefe fticks mult have their ends turned upwards, fo that the cafe may turn horizontally on their centres: at the oppofite fides of the cafes, at each end, bore a hole clofe to the clay with a gimblet, the fize of the neck of a common cafe of the fame nature; from thefe holes draw a line round the cafe, and at the under part of the cafe bore a hole with the fame gimblet, within $\frac{x}{2}$ diameter of each line towards the centre; then from one hole to the other draw a tight line. This line divide into three equal parts; and at X and Y (fig. 6.) bore a hole; then from thefe holes to the other two lead a quick-match, over which pafte a thin paper. Tig. 7. reprefents a tourbillon as it th uld lie to be fired, with a leader from one fidc.hole $A$ to the other 13 . When you fire tourbillons, lay them on a fmooth table, with their fticks downwards, and burn the leader thro' the middle with a port-fire. They flould fpin three or four leconds on the table before they 1 ife, which is about the time the compolition will be burning from the fideholes to thofe at bottom.

To tourbillons may be fixed reports in this manner: In the centre of the cafe at top make a fmall bole, and in the middle of the report make another: then place them together, and tie un the report, and with a fingle paper fecure it from fire: this done, your tourbillon is completed. By this method you may fix on tourbillons fmall cones of tars, rains, \&c. but be careful not to load them too much. One-eighth of an inch will be enough for the thicknefs of the nicks, and their length equal to that of the cafes.
59. 'To make Mortars to throw Aigrettes, and to load and fire then.
Mcitars to throw aigrettes are generally made of pafteboard, of the fame thicknefs as balloon mortars, and $2 \frac{1}{2}$ diameters long in the infide from the tep to the foot : the feot mult be made of elm without a chamber, but flat at top, and in the fame proportion as thofe for balloon mortars; thefc mortars mult alfo be bound round with a cord as beforementioned: fometimes 8 or 9 of thefe mortars, of about three or fuar inches diameter, are bound all together, fo as to appear but one : but when they are made fur this purpofe, the bottom of the foot mull be of the fame diameter as the mortars, and only $\frac{z}{2}$ diameter high. Your mottars being bound well together, fix them on a heavy folid block of wood. To load thefe mortars, firt put on the infide bottom of cach a piece of paper, and on it fpread $\mathrm{I}_{\frac{x}{2}}$ oz. of meal and corn powder mixed; then tie your ferpents up in parcels with quick-match, and pat them in the mortar with their mouths downwards; but take care the parcels dount fit too tight in the mortars, and that all the ferpe: ts have been sell primed with powder weted with firit of winc. On the top of the ferpents in
each mortar lay fome paper or tow; then carry a le.td. Air mater from one mortar to the other all round, and then locrs, \%. frum all the outide mortars into that in the midd's: thefe leaders mult be put between the cafcs and the fides of the mortar, down to the powder at bottom : in the centre of the middle mortar fix a fire-pump, no brilliant fountain, which mult be open at bottom, and long enough to project out of the mouth of the mortar; then pafte papcr on the tops of all the mortirs.

Mortars thats prepared are called a nef of firpsets, ab reprefented by fig. 8. When yon would fire thefe mor. tars, light the fire-pump C, which when confumed will communicate to all the mortars at once by means of the leaders. For mortars of 6,8 , or 10 inches diameter, the ferpents fhould be made in $t$ and 2 nunce cafes 6 or 7 inches long, and fired by a leader brought out of the mouth of the mortar, and turned down the nutfide, and the end of it covered with paper, to prevent the fparks of the other works from fetting it on fire. For a lix-inch mortar, let the quantity of powder for firing be 2 oz .; for an 8 -inch, $2 \frac{3}{4} \mathrm{oz}$.; and for a roinch, $3 \frac{3}{4} \mathrm{oz}$. Care mult be taken in thefe, as well as fmall mortars, not to put the ferpents in too tight, for fear of burfing the mortars. Thefe mortars may be loaded with flars, crackers, \&c.

If the mortars, when loaded, are fent to any diflance, or liable to be much moved, the firing powder fhould be fecured trom getting amongt the ferpents, which would endanger the moitars, as well as hurt their performance. To prevent which, load your mortars this: Firtt put in the firing powder, and fpread it equally abnut ; then cut a tound piece of blue touch-paper, equal to the exterior diameter of the mortar, and draw on it a circle equal to the interior diameter of the mortar, and notch it all round as far as that circle; then pafte that part which is notched, and put it down the mortar clofe to the powder, and flick the pafted edge to the mortar: this will keep the powder always fmooth at bottom, fo that it may be moved or carried anywhere without recciving damage. The large fingle mortars are called pots des aiorettes.

## Go. Making, loading, and fring, of Pots des Brius.

Thefe are formed of pafteboard, and matt be ro!led pretty thick. They are ufually made 3 or 4 inches diameter, and 4 diameters lung; and pinched with a neck at one end, like cummoncales. A uumber of thefe are placed on a plank thus: Having fixed on a plank twe rows of wooden pegs, cut in the bottom of the planl. a groove the whole length under each row of pegs: then, through the centre of each peg, bore a ho'e down to the gronve at bottom, ard on every peg fix and g!ue a pot, whofe mouth nult fit tight on the peg: through all the holes rim a quick-match, mend of which muf: go into the pot, and the other inte the groove, which mult have a match laid in it from end to end, and covered with paper, fo that when lighted at one end it many difcharge the whole almoft inftantaneoufly: in all the pots put about 1 oz . of meal and conn powder; then in fome put tars, and others rains, fnakes, ferpents, crackers, sic. when they are all loaded, palte paper over their mouths. Two or three hundred of thele pots being fired together make a very pietty thow, by affording fo great a variety of hires. Fif. 9. is a a ange of pots des bine, with a leader $A$, by which they are ficed.

$$
4 \mathrm{~T}^{2}
$$

61. Pois des Savieifons,

Are gencrally fired out of large mortars without chambers, the fame as thofe for aigrettes, only fomewhat fronger. Saucifons are made of 1 and 2 ounce cafes, 5 or 6 inches long, and choaked in the fame manner as ferpents. Half the number which the mortar contains muR be drove $1 \frac{1}{2}$ diameter with compofition, and the other half two diameters, fo that when fired they may give two volleys of reports. But if the morfars are very frong, and will bear a fufficient charge to throw the faucilons very high, you may make three volleys of reports, by dividing the number of cafes int.) three pats, and making a difference in the height of the charge. After they are tillej, pinch and tic them at top of the charge almoft clore; only leaving a fmall vent to communicite the fire to the upper part of the cafe, which moult be filled with corn-powder very near the top; then pinch the end quite clofe, and tie it: after this is done, bind the cafe very tight with waxed packithread, from the choak at top of the compolition to the end of the care; this will make the cafe very trong in that part, and caufe the report to be very loud. Saucillons fhould be rolled a little thicker of faper than the common proportion. When they are to be put in the mortar, the;' mult be primed in their mouths, and frred by a cafe of brilliant fire fixed in their centre.

The charge for thefe mortars fromld be $\frac{1}{6}$ th or $\frac{1}{5}$ th more than for pots des aigrettes of the fame diameter.

Sect. IV. Diffrent kinds of Rockets, with thsir Appendages and Combinations.

## 62. To fix one Rocket on the top of analber.

When fly-rockets are thus managed, they are called towecring rockets, on account of their mounting fo very high. Towering rockets are made after this manner: Fix on a pound-rocket a head without a collar: then take a four ounce rocket, which may be headed or bounced, and rub the mouth of it with meal-powder wetted with fpirit of wine: when done, put it in the head of the laige rocket with its mouth downwards; lout before you put it in, fick a bit of quick-match in the hole of the clay of the pound-rocket, which match thould be long enough to go a little way up the bore of the fmall rocket, to fire it when the large is burnt an:t, the 4 ounce rocket being ton fmall ts fill the head of the other, roll round it as much ow as wiil make it thand upright in the centre of the head: the rocket being thus fixed, pafte a fingle paper round the opening of the top of the head of the large rocket. The large onchet muft have o:ly half a diameter of charge ram. med above the piercer; for, if filled to the ufual height, it would tum before the fmall one takes fire, and en*Trelv deltroy the intended effert : when one rocket is Feaded with anotber, there will be no occafion for any Howing powder; for the force wi h which it fets off will be fufficient to dieng gige it from the head of the firt fired rochet. The licks for thefe rockets muft be a little lomer than for thre headed wi:h fars, rains, isc.

> Gi. Caduceus Ruclot,

In rifing, form two fipiel lines, of double worm, by Fafon of their being phaced obiiquely, ore oppofite
the other; and their counterpoife in their ientre, which Rockets caufes them to rife in a vertical direction. Rockets for \&s. this purpofe mult have their ends choaked clofe, with. out either head or bounce, for a weight at top would he a great obftruction to their mounting; though I have known them fometimes to be bouncecl, but then they did not rife fo high as thofe that were not ; nor do any caduceus rockets afcend fo high as fingle, becaufe of their ferpentine motion, and likewife the refiftance of air, which is much greater than two rockets of the fame fize would meet with if fired fingly.

By 2d fig. 9. you fee the method of fixing thefe reckets : the fticks for this purpofe muft have all their fides alike, which fides thould be equal to the breadth of at ftick proper for a fley-rocket of the fame weight as thofe you intend to ufe, and to taper downwards as ufual, long cnough to balance them, one length of a rocket from the crofs fick; which muft be placed from the large flick 6 diameters of one of the rockets, and its length 7 dianeecrs; fo that each rocket, when tied on, may form with the large fuick an angle of 60 degrees. In tying on the rockets, place their heads on the oppofite fides of the crefs Atick, and their ends on the oppofite fides of the long ftick; then carry a leader from the mouth of one into that of the other. When thefe rockets are to be fired, fufjeend them between two books or nails, then burn the leader through the middle, and both will take fire at the fame time. Rockets of I lb. are a good fize for this ufe.
64. Howorary Rockets,

Are the fame as fly-rockets, except that they carry no head nor report, hut are clofed at top, on which is fixed a cone; then on the cafe, clofe to the top of the flick, you tie on a 2 ounce cafe, about 5 or 6 inches long, filled with a thong charge, and pinched clofe at both ends; then in the reverfe fides, at each end, bore a hole in the fame manner as in tourbillons; from each hole carry a leader into the top of the rocket. When the rocket is fired, and arrived to its proper height, it will give fire to the cafe at top; which will caufe both rocket and ftick to fpin very faft in their return, and reprefent a worm of fire defcending to the ground.

There is another method of placing the fmall cafe, which is by letting the fick rife : little above the top of the rocket, and tying the cafe to $i$, fo as to reft on the rocket: thefe rockets have no concs.

There is alfo a third method by which they are ma. naged, which is thus: In the top of a rocket fix a piece of wood, in which drive a fmall iron fpindle; then make a bole in the middle of the fmall cafe, through which put the fpindle: then fix on the trip of it a nut, to keep the calle from falling off; when this is done, the cafe will turn very faft, without the rocket: but this method does not anfiwer fo well as either of the former.

Fig. io. is the honorary rockict enmplete. The beit fized reckets fur this purpele are thofe of : lb .
G5. To divide the tail of a Sky-rocket fo as to form an Airch ruber afocndiw.
IFaving fome rockets made, and headed according to fancy, :mal tied na their llicks; git fome fheet tin, and cut it into round pieces abont 3 or 4 inches diameter; then on the itick of e:rh rocket, under the mouth of the caic, fix one of thefe pieces of tin it inches from the rocket's neck, and fupport it by a wooden tracket,
, as frong as polfible: the ufe of this is, that when the rocket is afcenuing the fire will play with great force on the tin, which will divide the tail in fuch a manner that it will form an archas it mounts, and will have a very goodeffert when well managed : if there is at thort piecc of port-firc, of a Arong charge, tied to the end of the ftick, it will make a great addition; but this muft be lighted before yon fire the rocket.
66. To make fereral Sty roch ts tifo in the fame diecction, and equilly diffant from cach other.
Take fix, or any number of iky-rockets, of what fize you pleafe, then cut fome firone pack thred into pieces of 3 or 4 yards long, and tie each ond of thare pieces to a rocket in this manner: Having tied one end of your packthread round the boíy of one rocket, and the other end to another, take a lecond piece of packthread and make one end of it fat to che of the rock. ets alrcady tied, and the other end to a third rocket, fo that all the rockets, except the two outide, will be fattened to two pieces of packthread: the lenorth of thread from one rocket to the other may be what the maker pleafes; but the rockets inult be all of a fize, and their heads filled with the fame weight of Atars, rains, \&ce.
Having thus done, fix in the mouth of each rocket a leader of the fame length; and when you are going to fire them, hang thena almoft clofe; then tie the ends of the leaders together, and prime them: this prime being fired, all the rockets wiil mount at the fame time, and divide as far as the ftrings will allow ; which divifion they will keep, provided they are all rammed alike, and well made. They are called by fome chained rockets.

## 67. Signal Sky-rockets

Are made of feveral kinds, according to the different fignals intended to be given; but in artificial fireworks, two forts are only uted, which are one with reports and the other without; but thofe for the ufe of the navy and army are headed with ftars, ferpents, \&e. - Rockets which are to be bounced muft have their cafes made $1_{\frac{1}{2}}$ or 2 diameters longer than the common proportion; and after they are filled, drive in a donble quantity of clay, then brunce and pinch them af. ter the ulual manner, and fix on each a cap.
Signal iky-rockets withont bounces, are only ikyrockets clofed and capped: thefe are very light, therefore do not require fuch heavy iticks as thofe with loalcd heads; for which reafon you may cut one length of the rocket off the ltick, or elfe make them thimer.

Signal rockets with reports are fired in frall flights; and often both thefe, and thofe withont reports, are ufed for a fignal to begin firing a collestion of works. 68. To fax a Sky-rokict ruith its sticic on the top of another.
Rockets thus managed niake a pretty appearance, by reaton of a freth tail being feen when the fecond rocket takes fire, which will mount to a great height. The method of prera: ins thefe rockets is thus: Haring filled a two-pounder, which mult te filled only lalf a diameter above the picicer, and its bead n ( more than 10 or 12 fiars; the flick of this rocket mult be made a Bitle thicker than comnoon; ard when made, cut it in Walf the flat way, and in each haif make a groove, fo that when the two halves are joined, the hollow made by the grooves may be large enough to hold the flick
of a half.pound recket; which mochet make and lead Rukei, as ufual : put the fick of this rocket into the lichuw of t. the large one, fo far that the mouth of the 1 cebet moy reft on the head of the two-pounder; from whoie Le..d carry a leader into the mowh of the fmall rochet; which being done, jour roekets will be ready fir firing.

2d 63. To fix tzupor more Siy-reckets an ore Stil:.
Two, three, or fix fiky-rockets, fixed on one fick, ard fired toge:her, make a grand and beautiful appearance; for the taits of all will feem but as one of aia irrmenfe fize, and the braking of fo many heads at ome will refemble the burfing of an air-billoon. The management of this device requires a fkilful hand; but if the following inftruations be well obierved, even loy thofe who have not made a great progrefs in this at. there will be mo doubt of the rockets having the defised effect.
Rockets for this purpofe mult be made with the greateft exaftufs, all rammed by the fame hand, in the fame mould, and out of the f.ame proportion of compifition; aril after thes are filled and headed, mut all he of the fame weight. The fick muft alfo be well made (and proportioned) to the following direrions: firf, fuppofing your rockets to be $\frac{x}{2}$ pounders, vihofe Ricks are 6 feet 6 inches long, then il 2,3 , cr 6 of theic atre to be fised on 1 fick, let the length of it is 9 feet 9 inches; then eut the top of it irito as manny lides as there are ronkets, and let the length of eich fide be equal to the length of 1 of the rockeis without its head; and in cach fide cut a gronve (as unala) ; then from the grooves plane it round, down to the bottom, where its thicknefs muft be equal to half the top of the round part. As their thicknefs cannot be exactly afcertained, we fhall give a rule which generally aniwers for any number of rockets above two: the roie is this; that the flick at top mult be thick enourh, whent the grooves are cut, for all the rockets to lie, without prefling each other, though as near as pofible.
When only 2 rockets are to be fixed on one tick, let the length of the ftick be the laft given proportic, 1 , but haped after the common method, and the bread: and thicknefs doulle the ufual dimenfions. The poine of poife mult be in the ufual place (let the numbir of rockets be what they will) : if llicks made by the above directions thould be too heavy, plane them thimer; and if too light, make them thicker ; but awoys make them of the fame length.

When more than two rockets are iied on one fich, there will be fome danger of their lying up without the flick, unlefs the following precaution is taken: Fcer cafes being placed on all fides, there can be wen netches for the cord which ties on the rockets to lie in ; therefore, inflead of rothes, dive at imath nail in each frice of the fick, between the necks of the cafes: an! lut the cord, which goes round their necke, be brou-cht chofe under the nails; by this means the rociets will be as fecure as when tied on ingly. Your rockets being thas fixed, carry a quick-matli, wihout a fipe, from the mouth of one rocket to the other; this match being lighted will give fire to all at once.

Though the direaiens alre.dy given may be fuftcient for thele rockets, we flall her: add an improvement on a very efiential part of this desice, which in. that of hanging the rachets to be lired; for before the
following method was hit upon, many effays ptoved unfuccefstul. Inteal, therefure, of the old and common mancr of hanging them on nails or hooks, make ufe of this contrivance: Have a ring made of flong iron wire, large enough for the fick to goin as far as the mouths of the rockets; then let this ring be fupported by a fmall iron, at fome dittance from the polt or fand to which it is fixed; then have ancther ring, fit to receive and suide the fmall end of the ftick. Rockets thus fuffended will have nothing to obtruct their fire ; but wien they are hung on nails or hooks, in fuch a manner that forme of their months are againft or upon a rail, there can be no certainty of their rifing in a vertic:1 direction.

## 69. To fire Sky-rockets woithout Sicks.

You mult have a fand, of a block of wood, a font diamster, and make the bottom flat, fo that it may 1tand Iteady: in the centre of the top of this block draw a circle $2 \frac{1}{2}$ inches diameter, and divide the circumference of it into three equal parts; then take 3 pieces of thick iron wire, each about three feet long, and drive them into the block, 1 at each point made on the circle; when thefe wires are drove in deep enough to hold them falt and upright, fo that the dilance from one to the other is the fame at top as at bottom, the fland is complete.

The itand being thus made, prepare your rockets thus: Take fome common fky -rockets, of any fize, and head them as you pleafe; then get fome balls of lead, and tie to e ch a fmall wire 2 or $2 \frac{1}{2}$ feet long, and the other end of each wise to tie to the neck of a rocket. Theie balls anfwer the purpofe of ticks when made of a proper weight, which is about $2-3$ ds the weight of the rocket; but when they are of a proper fize, they will balance the rocket in the fame manner as a fick, at the ufual point of poife. To fire thefe, hang them, wne at a time, between the tops of the wires, letting their heads relt on the point of the wires, and the balls hang duwn between them : if the wires fhould be too wide fur the rockets, prefs them together till they fit; and if too clofe, force them open; the wires for this purpofe mut be foftened, fo as not to have any fpring, ir they will not keep their pofition when preffed clofe or ipened.
To. Raingall's and Stars for Sky-ruckets, Double and
Gold and filver rain compofitions are drove in cafes that are pinched quite clofe at one end: if you roll 1hem dry, 4 or 5 rounds of paper will be ftrong enough ; but if they are pafted, 3 rounds will do ; and the thin fort of cartridge-paper is beft for thofe fmall cales, which in rolling you muft not turn down the intide edge as in other cafes, for a double edge would be wo thick for fo inall a borc. The moulds for raintalls thould be mide of brafs, and turned very finooth in the infide; or the ca?cs, which are fo very thin, would tear in coming out; for the charge maft be drove in titht; and the better the cafe fits the mould, the more driving it will bear. Thefe moulds have no mipple, but inftead thereof they are made flat. As it would be very tedious and troublefome to thake the compolition cut of fuch fimall lades as are ufed for thefe cales, it will be necefliry to have a funncl made of thin tin, to fit on the top of the cafe, by the help of which you my all them very fath. For fingle rain-
falls for 4 oz. rockets, let the diameter of the former Rocl be $2-16$ this of an inch, and the length of the cafe $2 \stackrel{8 \mathrm{cc} \text {. }}{\text {. }}$ inches; for 8 oz . :ockets, $4 \cdot 16$ ths and 2 diameters of the rocket 1 ng ; for 11 b . rockets, $5-16$ ths, and 2 diameters of the rocket long; for 2 lb . rockets, $5-16$ ths, and $3 \frac{x}{2}$ inches long; for 4 lb rockets, 6.16 chs , and $4 \frac{x}{2}$ inches long; and for 6 -pounders, $7-16$ ths diameter, and 5 inches long.

Of double rain-falls there are two forts. For example, fome appear firf like a far, and then as rain; and fome appear firt as rain, and then like a llar. When you would have flars firf, you muft fill the cales, within $\frac{x}{2}$ inch of the top, with rain-compofition, and the remainder, with far-compofition; but when you intend the rain fhould be firf, drive the cafe $\frac{1}{2}$ an inch with far-compofition, and the reft with rain. By this method may be made many changes of fire; for in large rockets you may make them firf burn as ftars, then rain, and again as ftars; or they may firf thow rain, then fiars, and finifh with a report; but when they are thus managed, cut open the firft rarmed end, after they are filled and bounced, at which place prime them. The ftar compofition for this purpofe mult be a little ftronger than for rolled fars.

Strung fars. Firlt take fome thin paper, and cut it into pieces of $\mathrm{I}_{\frac{1}{2}}$ inch fquare, or hereabnuts; then on each piece lay as much dry far-compofition as you think the paper will eafily contain; then twilt up the paper as tight as you can; when done, rub fome pafte on your hands, and roll the ftars between them; then fet them to dry: yonr flars being thus made, get fome flax or fine tow, and roll a litule of it over each flar; then pafte your hands and roll the fars as before, and fet them again to dry; when they are quite dry, with a piercer make a hole through the middle of each, into which run a cotton quick-match, lorg-enough to hold 10 or 12 llars at 3 or 4 inches diftance: but any number of fars may be frung together by joining the match.

Tailed fars. Thefe are called tailed fars, because there are a great number of fparks iffuing from them, which reprefent a $t$ iil like that of a comet. Of thefe there are two forts; which are rolled, and dreve: when rolled, ther mut be moiftened with a liquor made of half a pint of tpirit of wine and half a gill of thin fize, of this as much as will wet the compofition enough to make it roll edfy; when they are rolled, fift meal-powder over them, and fet them to dry.

When tailed fars are drove, the compofition muft be moiftened with firit of wine only, and nat made fo wet as for rolling: 1 and 2 oz. cafes, rolled dry, are bell for this purpofe; and when they are filled, unroll the cafe within 3 or 4 rounds of the charge, and all that you unroll cut off; then pifte down the loofe edge: 2 or 3 days after the cafes are filled, cut therm in pieces 5 or 63 ths of an inch in length: then melt fome wax, and dip one end of each picce into it, ro as to cover the compofition: the other end mult be rubbed with meal powder wetted with firit of wine.

Drove fars. Cafes tor drove ftars are rolled with pulte, luit arc made very thin of paper. Before you begin to fill them, damp the compofition with fpirit of wire that bas had fome camphor diffolved in it: you may ram them indifferently hard, fo that you do not break or fack the cafe; to prevent which, they
flould

Mould fit tight in the mould. 'They are drove in cafes of feveral fizes, from 8 drams to 4 oz . When they are filled in $\frac{1}{2}$ oz. cafes, cut them in pieces of $\frac{3}{4}$ of an inch long ; if $10 \%$ cales, cut them in pieces of 1 inch ; if 2 oz. cafes, cut them in pieces of $1 \frac{1}{3}$ ioch long; and if 4 oz. cafes, cut them in pieces of $1 \frac{1}{\frac{1}{3}}$ inch long: having cut your llars of a proper lize, prime boih ends with wet meal-powder. Thefe fars are feldom put in rockets, they being chiefly intended for air-balluons, and drove in cafes, to prevent the compolition from being broken by the force of the blowing powder in the fhell.

Rolling fars are commonly made about the fizc of a mufket-ball; thrugh they are rolled of feveral fizes, frem the bignels of a pillol-lall to $t$ inch dis. meter; and fonctimes very inall, but are then called fparks. Great care mula be takea in making ftats, firft, that the ieveral ingredien $s$ are reduced to a finc powder ; fecondly, thit the compolition is well worked and mixed. Belore you begm to roll, take about a pound of compofition, and we: it with the following liquid, enough to make it fick together and roll eafy : SFirit of wine I quart, in which diffolve $\frac{1}{4}$ of an ounce of ilinglafs. If a great quantity of compofition be wetted at once, the fipirit will evaporate, and leave it dry, before you can roll it into flurs : having rolled up one proportion, fhake the ftars in meal-powder, and fet them to dry, which they will do in 3 or 4 days; but if you flould want them for immediate ufe, dry them in an earthen pair over a flow heat, or in an oven. It is very difficult to make the fars all of an equal fize when the compofition is taken up promifcuoufly with the fingers; but by the following method they may be made very exact : When the mixture is noiftened priperly, roll it on a flat fmooth fone, and cut it into fquare pieces, making each fquare large enough for the ftars you intend. There is another method ufed by fome to make ftars, which is by rolling the compofition in long pieces, and then cutting off he flar, fo that each far will be of a cylindrical form: but this method is not fo good as the former; for, to make the compofition roll this way, it mult be made very wet, which makes the ftars heavy, as well as weakens them. All fars mult be kept as much from air as poffible, otherwife they will grow weak and bad.

## 7r. Scrolls for Sky-rockets.

Cafes for fcrolls fhould be made 4 or 5 inches in length, and their interior diameter 3 -Sths of an inch : one end of thefe cafes mult be pinched quite clofe, before you begin to fill; and when filled, clofe the other end: then in the oppofite fides make a fmall hole at eacl. end, to the compofition, in the fame manner as in tourbillons; and prime them with wet meal.powder. You may put in the head of a rocket as many of thefe cafes as it will contain: being fired they turn very quick in the air, and form a feroll or fpisal line. They are generally filled with a flong charge, as that of fel pents or brilliaut fire.
72. Swarniers, or fmall Rockets.

Rockets that go under the denomination of fuarmers, ale thofe from 2. oz. downwards. Thefe rockets are fired fometimes in flights, and in large waterworks, \&c. Swarmers of 1 and 2 oz . are bored, and made in the fame manner as large rockets, except that,
when headed, their heads muft be put on wihhout a Rockicts, collar: the number of ftrokes for driving i $0 \%$ mult be \&e. 8 , and for 2 oz. 12.

All rockets under 1 oz . are not Lored, but muft be filled to the ufual height wi:h compofition, s. hich generally confifts of fine meal-porder $40 z$. and charcoal or fteel-dult 2 drams: the number of ftrokes for ramning thefe foall fwarmers is not material, provided they are rammed truc, and moderately hard. 'l'he necks of unbored rockets mult be in the dime proportion as in common cafes.
73. Stunds for Sly-rockets.

Care muft be taken, in placing the rockets when they ate to be fired, to give them a ventical directiona at their firlt tetting out; which may be managed thus. Have two rails of wood, of any length, fupported at each end by a perpendicular leg, fo that the rails be horizontal, and let the dillance irom one to the other be alnooft equal to the length of the fticks of the rockets intended to be fired; then in the front of the top rail drive fquare books at 8 inches dif:ance, wids their puints turning fidewife, fo that when the rockets ale hung on them, the points will be belore the ficl: 3 and keep them from falling or bcing blown off by the wind: in the front of the rail at botum muft be ftaples, drove perpendicular under the hooks at top; through there flaples put the fmall ends of the rocket-fticks. Rockets are fired by applying a lighted port fire to their mouths.
$N . B$. When fky-rockets are made to perfecion, and fired, they will ftand 2 or 3 leconds on the hook before they rife, and then mount up bilkly, with a fleady motion, carrying a large tail from the ground all the way up, and jult as they turn break and difperie the ftars.

## 74. Girandole Chefss for Flights of Rockets.

Thefe are generally compofed of four fides, of equal dimenfions ; but may be made of any diameter, according to the number of rockets defigned to be fired; its height mult be in proportion to the rockets, but muft always be a little higher than the rockets with their fticks. When the fides are joined, fix in the top, as far down the cheft as the length of one of the rockets with its cap on. In this top, make as many fquare or round holes to receive the rocket-תicks, as you intend to have rockets; but let the d.ftance between them be fufficient for the rockets to ftand without touching one another; then from one bole to another cut a groove large enough for a quick-match to lic in: the top being thins fixed, put in the botom, at about 1; foot ditance from the cotinm of the cheft; in this bottom mult be as many holes as in the top, and all to correfpond; but thefe holes need nct be fo large an thofe in the top.

To prepare your cheft, you mult lay a quick-match, in all the gronves, frum hole to hole; then tahe fome fky-rockets, and rub them in the mouth with wet mealpowder, and puta bit of match up the cavity of each ; which match muft be long enough to lang a little below the mouth of the rocket. Your rockeis ard cheit being prepared according to the above direntions, put the llicks of the rockets through the holes in the top and bottom of the cheft, fo th.it their mouths may relt ou the quick-match in the gronves: by which all the rockets will be fired at once; for by giving fire to any

Fart of he match, it will communicate to all the rockets in an in:fant. As it would be rather troublefome to direat the flicks from the top to the proper holes in the bectom, it will be necefliary to have a fmall door in one of the fides, which, when opened, you may fee how to place the fticks. Flights of rockets heing feldom fet of at the beginning of any fire-works, they are in danger of being fired by the farks from wheels, sic. therefore, to preferve them, a cover fhould be made to fit on the cheit, and the door in the fide kept thut.

## 75. Serpents or Suakes for Pots of Aigrettes, finall RILertars, Say-rackets, FFic.

Surpents for this ule are made from $2 \frac{1}{2}$ inches to 5 incles 1 mg , and their formers from $3 \cdot 16$ ths to $5 \cdot 8$ ths of an inch diamoter; but the diameter of the cales muit always be equal to 2 diameters of the former. 'lhey are rolle 3 and choaked like other cates, and fill. cu with compofition from 5 -Sth of an inch to $1 \frac{1}{2}$ inch high, according to the fize of the mortars or rockets they are daggned for; and the remainder of the cafes hounced with corn powder, and atterwards their ends pincled and tied cloic: before they are ufed, their mouths mult be primed with wet meal powder.
75. Leud i's, or Pipes of Communication.

The bef paper for leaders is elephant; which you cut into long nips 2 or 3 inches broad, fo that they say go 3 or 4 times round the furmor, but not more: Wh.n they are very thick, they are too Atrong for the fapor which fatens them to the worl:s, and will fometimes fly off without leading the fire. The formers for thetc leaders are made from 2 to 6 -1 Gths of an inch diameter ; but 4 - 1 this is the fize generally made ufe ot. The formers are made of fmooth brafs wire: when you wie then, rub them over with greafe, or keep them wet with pafte, to prevent their iticking to the paper, which mult be pated all over. In rolling of pipes, malie we of a rolling-board, but ufe it lightly : having :olled a pipe, datw out the former with one hand, holding the pipe as light as pofible with the other; for if is prefs againft the former, it will Atick and tear the paper.
N. $D$. Make your leaders of diferent lengths, or in doihing of worts you will cut a great many to wafte. Leaders for marron batteties matt be made of fiong c.artiidge paper.

> 77. Crachers.

Cut fome cartridge paper into picces $3 \frac{1}{2}$ inclies broad, and une fout lons; one edge of each foud down length. vie about 3 of an inch broad; then fold the double cide dowa $\frac{1}{f}$ of an inch, and turn the fingle edge back b hf over the donble fold; then open it, and lay all aione the chamel, which is formed by the dolving of the farce, fone meal porver; then fold it orer and wor till all the paper is doubled nip, rubling it down every tura; this dune, liend it backwards and forwards, $x_{2}^{2}$ inches, or therealsuts, at a time, as oft as the paper wili allow; then hold all thefe foids that and clofe, and with a fnall piuching cord gire one turn round the middle of the cracker, and pinch it clofe; then bind it with a packithead as tight as yon can; then, in the f ace where it was pinclic!, prime one cud of it, and cap it with tonch-paper. When thefe crackers are fired, they will give at report at every turn of the paper: if jon wonld have as grcat number of bounces,
you muft cut the puper longer, or join themafter they R are made; but if they are made very long before they ${ }^{s}$ are pinched, yom molt hate a piece of wood with a groove in it, deep enough to let in half the cracker; this will hold it fit ight white it is pinching. Fig. Iz. reprefents a cracker complete.
78. Sing'e R.ports,

Cafes for reports are generally rolled on one and two oz. formers, and feldom made larger but on particular occalions ; they are made from two to four inches long, and reay thick of papar. Having rolled a cafe, pinch one end quite clofe, and drive it down: then fill the cafe with corn-powder, only leaving room to pinch it at top; but before you pinch it, put in a piece of paper at top of the powder. Reports are fired by a vent, bored in the middle, or at one end, jult as required.

## 79. Marrons.

Formers for marrons are from $\frac{3}{4}$ of an inch to $I^{\frac{1}{2}}$ diameter. Cut the paper for the cates twice the diameter of the former broad, and long enough to go three times rovad: when you have rolled a cafe, paite down the edge and tie one end clofe; then with the former drive it down to take away the wrinkles, and make it flit at bottom; then all the cafe with corn-powder one diameter and $\frac{x}{4}$ high, and fold down the reft of the cafe tight on the powder. The marron being thus made, wax fome flrong pack-thread, with fhoemakers wax; this thread wind up in a ball, then unwind twe or three yards of it, and that part which is near the ball make faft to a hook; then take a marron, and fland as fas from the hook as the pack-thread will reach, and wind it lengthwitc round the marron as clofe as you can, till it will hold no more that way; then turn it, and wind the packthread on the fhort way, then lengthwile again, and fo on till the paper is all covered; then make faft the end of the packtliread, and beat down both ends of the marron to bring it in thape. The method of firing marrons is by making a hole at one end with an awl, and putting in a piece of quick match; then take a piece of Arong paper, in which wrap up the marron with two leaders, which mult be put down to the vent, and the paper tied tight round them with frall twine: thele leaders are bent on each fide, and their lonfe ends tied to other marrons, and are nailed in the middle to the sall of the ftand, as in fig. 13. The ufe of winding the packithread in a ball is, that you may let it out ay you want it, according to the quantity the matron may require; and that it may not be tied in knoss, which would fooil the marron.
8o. Miarron Datteries,

If well managed, will keep time to a march, or a Row piece of ruslic. Narron batteries are made of feveral itands, with a number of crofs rails for the marrons; which are regnlated by leadeis, by cutting them of different lengells, and nailing them tieht, or looli, accorting to the time of the antific. In marron batteries you mut ufe the large and fmall marrons, and the mails for the pipes mult have flat heads.
81. Lime Rockes.

Are mate and drove as the fiky-rnckets, but have no heads, and the cafes mult be cut clofe to the clay: they are fometimes made with fix or feven changes, but ingenctal not more than four or five. The method of manasing thofe rockets is thus: Firf, have a piece of light wood, the length of one of the rockets, turned round
tockets, round about $2 \frac{1}{8}$ inches diameter, with a bole thecugh the middle lengthwife, large cnough for the line to go cafily through : if you delign four changes, have four gronves cur in the fiwivcl, one oppofite the other, to lay the rockets in.

The mouths of the rockets being rubbed with wet meal-powser, lity them in the grooves head to tail, and tie them fult; from the tail of the firf rocket carry a leader to the inouth of the fecond, and from the fecond to the third, and foo on to as many as there are on the fwivel, making every leader very fccure; but in fixing thefe pipes, take care that the quick-matcla docs not enter the borcs of the rockets: the rockets being fixed on the fwivel and ready to be fired, have a line 1co yards long, fretched and fixed up tight, at any height from the ground; but be fure to place it horizontally : this length of line will do for $\frac{1}{2} \mathrm{ll}$. rockets; but if larger, the line muft be longer. Before you put up the line, put one end of it through the fwivel; and when you firc the line rocket, let the mouth of that rocket which you fire firt face that end of the line where you ftand; then the firlt rocket will carry the reft to the other end of the line, and the fecond will bring them back; and fo they will run out and in according to the number of rockets: at each end of the line there mult be a piece of flat wood for the rocket to ftrike againft, or its force will cut the line. Let the line be well foaped, and the hole in the fwivel very fmooth.
82. 1)ifferent Decorations for Line Rockets.

To line rockets may be fixed great varisty of figures, fuch as flying dragons, Mercuries, thips, \&c. Orthey may be made to run on the line like a wheel; which is done in this manner. Have a flat fwivel made very exact, and on it tie two reckets obliquely, one on each fide, which will make it turn round all the way it goes, and form a circle of fire; the charge for thele rockets fould be a little weaker than common. If you would fhow two dragons figlting, get two fwivels made fquare, and on each tie three rockets together on the under fide ; then have two flying dragons made of tin, and fix one of them on the top of each fwivel, fo as to ftand upright ; in the mouth of each dragon put a fmall cafe of common fire, and another at the end of the tail; you mas put two or three port-fires, of a ftrong charge, on one fide of their bodies, to fhow them. This done, put them on the linc, one at each end; but let there be a fwivel in the middle of the line to keep the dragons from feriking togelher: before you fire the rockets, light the cafes on the dragons; and if care be taken in firing both at the fame time, they will meet in the middle of the line, and feem to fight. Then they will run back and return with great violence; which will have a very pleafing effect. The line for thefe rockets muft be very long, or they will ftrike too lard together.

## 83. Chinefe Flyers.

Cafes for flyers may be made of different fizes, from one to eight ounces : they mult be made thick of paper, and eight interior diametcrs long; they are rolled in the fame manner as tourbillons, with a fraight pafted edge, and pinched clofe at one end. The method of filling them is, the care being put in a mould, whofe cylinder, or foot, mill be flat at top without a nipple, fill it within ${ }_{7}$ a diameter of the middle; then ram in ; a diameter of clay, on that as much compofition as

[^5]before, on which drive i a diamcter of claty; then pinch Rockets, the cafe clofe, and dive it down flat; afier this is donc, \&e. bore a hole exactly throu? h the centre of the clay in the middle; then in the oppofite fides, at bothends, make a vent, and in that fide you intend to fire firle malic a fmall hole to the compofition near the clay in the middle, from which carry a quick match, covered with a fingle paper, to the vent at the other end; thea, when the chargc is burnt on one fide, it will, by means of the quick-match, communicate to the charge on the other (which may be of a different fort). The flycrs being thus made, put an iron pin, that muft be fixed in the work on which they are to be fired, and on which they are to run, througla the hole in the middle; on the end of this pin mult be a nut to keep the flyer from running off. If you would have them turn back again aficr they are burnt, make botlo the vents at the ends on the fame fide, which will alter its courfe the contrary way.

## S. Table Rockets,

Are defigned merely to fhow the truth of driving, and the judgment of a fire-worker, they having no other effect, when fired, than fpinning round in the fame place where they begin, till they are burnt out, and fhowing nothing more than an horizontal circle of fire.

The method of making thefe rockets is-Have a cone turned out of hard wood $2 \cdot$ inches diameter, and as much high; round the bafe of it draw a line ; on this line fix four fpokes, two inches long each, fo as to fand one oppofite the other; then fill four nine-inch one lb . cafes with any frong comp)fition, within two inches of the top: thefe cafes are made like tourbillons, and mult be rammed with the greateft exactnefs.

Your rockets being filled, fix their open ends on the fhort fpoke; then in the fide of each cafe bore a hole near the clay; all thefe holes, or vents, mult be fo made that the fire of each cafe may act the fame way; from there vents carry leaders to the top of the cone, and tie them togetber. When you would fire the rockets, fet them on a fmooth table, and light the leaders in the middle, and all the cafes will fire together (fee fig. 14.) and fpin on the point of the cone.

Thefe rockets may be made to rife like tourbillons, by making the cafes fhorter, and boring four holes in the under fide of each at equal diftances: this being done, they are called double tourbillons.

Note, All the vents in the under fide of the cafes mult be lighted at once; and the fharp point of the cone cut off, at which place make it fpherical.

## Sect. V. Of Wheels and other Works.

## 85. Single Vertical Wheels.

There are different forts of vertical wheels; fome having their fells of a circular form, others of an heragon, octagon, or decagon form, or any number of fides, according to the length of the cafes you defign for the wheel : your fpokes being fixed in the nave, nail flips of tin, with their edres turned up, fo as to form grooves for the cafes to lie in, from the end of one fpoke to another; then tie your cafes in the grooves head to tail, in the fame manner as thofe on the horizontal waterwheel, fo that the cafes fucceffively taking fire from one another, will keep the wheel in an equal rotation. Two of thefe wheels are very cft fired together, ore on each

Plate ceccrix.
and all the cafes fllled alike, 10 make them keep time together; which they will do if made by the following dircetions. In all the cafes of both wheels, except the firlt, on each wheel drive two or three ladles full of how fire, in any part of the cafes; but be carcful to ram the fame quantity in each cafe, and in the end of one of the cates, on each whecl, you may ram one ladlefull if dead-fire compofition, which muft be very lighty drose; you may alfo make many changes of fire by this method.

Let the hole in the nave of the whecl be lined with brat's, and inade to turn on a fmooth iron fpindle. On the end of this fpindle let there be a nut, to fcrew off and on; when you have put the whecl on the findle, forew on the nut, which will keep the "heel from flying off. Let the mouth of the firt cafe be a little raijed. See fig. 15. Vertical wheels are made from 10 inches to 3 feet diameter, and the fize of the cafes mutt difier accordingly; 4.0z. cafes will do for whecls of 14 or 16 inches diameter, which is the proportion gencsally ufed. The beft wood for wheels of all forts is a light and dry beech.

## 86. Horizontal Wheils,

Are beft when their fells are made circular; in the middle of the top of the mave mult be a pintle, turned out of the fame picce as the nave, two inches long, and equal in diameter to the bore of one of the cafes of the wheel: there muft be a hole bored up the centre of the nave, within half an inch of the top of the pintle. The wheel being made, nail at the end of each fpoke (of which there thould be fix or eight) a piece of wood, with a groove cut in it to receive the cafe. Fix thefe pieces in fuch a manner that halt the cafes may incline up. wards and half downwards, and that, when they are tied on, their heads and tails may come very near together; from the tail of one cafe to the mouth of the other carry a leader, which fecure with pafted paper. Befides thefe pipes, it will be neceffary to put a little meal-powder infide the pafted paper, to blow off the pipe, that there may be no obftruction to the fire from the cafes. By means of thefe pipes the cafe will fucceflively take fire, burning one upwards and the other downwards. On the pintle fix a cafe of the fame fort as thofe on the wheel; this cafe mult be fired by a leader from the mouth of the laft cafe on the wheel, which cafe muft play downwards: inftead of a common cafe in the middle, you may put a cafe of Chinefe fire, long cnough to burn as long as two or three of the cafes on the wheel.

Horizontal wheels are oft fired two at a time, and made to keep time like vertical wheels, only they are made without any flow or dead fire; 10 or 12 inches will be enough for the diameter of wheels with fix fpokes. Fig. 16. reprefents a wheel on fire, with the firt cafe burning.

## 87. Sfiral Wheels,

Are only double hoizontal wheels, and made thus: The nave mult be about 6 inches long, and fomewhat thicker than the fingle fort; inftead of the pintle at top, make a hole for the cafe to be fixed in, and two fets of fpokes, one fet near the top of the nave, and the other near the bottom. At the end of each fpoke cut a groove wherein you tie the cafes, there being no fell; the fookes thould not be more than $3 \frac{1}{2}$ inches long from

9 inches diameter; the cafes are placed in fuch a man- \&s.
ner, that thofe at top play dowr, and thofe at bottom play up, but let the third or fourth cafe play horizontally. The catc in the middle may begin with any of the others you pleafe: 6 fpokes will be enough for each fet, fo that the wheel may confift of 12 cales, befides that on the tup: the cafes 6 inches each.
88. Plural Whacels,

Are made to turn horizuntally, and to confift of three fets of fpokes, phaced 6 at top, 6 at bottom, and 4 in the middle, which mut be a little thorter than the reft : let the dimmeter of the wheel be 10 inches; the cafes mult be tied on the ends of the fpokes in grooves cur. on purpofe, or in pieces of wood nailed on the ends of the fpokes, with grooves cut in them as ufual : in clothing thefe whee's, make the upper fet of cafcs play obliquely downwards, the bottoni fet cobliquely nowards, and the middle fet horizontally. In placing the lcaders, you muft order it fo that the cafes may burn thus, viz. firt up, then down, then horizontal, and fo on with the reft. But another change may be made, ly driving in the end of the 8th cafe two or three ladlefuls of how fire, to burn till the wheel has fopped its courfe; then let the other cafces be fixed the contrary way, which will make the wheel run back again: for the cafe at top you may put a fmall gerbe; and let the cafes on the fpokes be fhort, and filled with a ftrong brilliant charge.

> 39. Illuminated Spiral IWheel.

Firft have a circular honizontal wheel made two feet diameter, with a hole quite through the nave; then take three thin pieces of deal, thee feet long each, and $\frac{3}{4}$ of an incl broad each: one end of each of thefe pieces nail to the fell of the wheel, at an equal difance from one another, and the other end nail to a block with a hole in its bottom, which mult be perpendicular with that in the block of the wheel, but not fo large. The wheel being thus made, have a hoop planed down very thin and flat; then nail one end of it to the fell 'f the wheel, and wind it round the three fticks in a fpiral line from the wheel to the block at top : on the top of this block fix a cafe of Chinefe fire; on the whecl you may place any number of cafes, which muft incline downwards, and burn two at a time. If the wheel hould confit of 10 cafes, you may let the illuminations and Chinefe fire begin with the fecond cafes. The fpindle for this wheel muft be a little longer than the cone, and made very fmooth at rop, on which the upper block is to turn, and the whole weight of the wheel to relt. Seefig. 17. 90. Doutle Spiral Wheil.

For this wheel the block, or nave, mult be as long as the height of the worms, or fpiral lines, but mult be made very thin, and as light as pofible. In this block muft be fixed feveral fpoke, which mutt diminifh in length, from the wheel to the top, fo as not to exceed the furface of a cone of the fame height. To the ends of thefe postes mail the worms, which muft crofs each other feveral times: thefe worms clothe with illumina. tions, the fanie as thate on the fingle wheels; but the horizontal wheel you may clothe as you like. At top of the worm place a cafe of fpur-fire, or an amber light. See fig. I8. This figure is fhown without leaders, to prevert a confufion of lincs.
91. Balloon Wheels,

Aremade to turn horizontally: they muft be made 2 feet

Whecls, 2 fect diameter, without any fpokes; :nd very Atoner, with any number of fides. On the top of a whecl range and fix in pots, 3 inches diameter and 7 inches high cach, as many of thefe as there are cates on the whed: near the bottom of each pot make a fmall vent ; into each of thefe vents carry a leader from the tail of cach care; fume of the pots load with fiars, and fome with ficrpents, crackers, \&c. As the whecls turn, the pots will fucceflively be fired, and throw into the air a gicat variety of fires.

## 92. Fruiloni IWhee's.

Firft have a nave made 9 incles long and 3 in diameter: near the buttom of this nave fix 8 fpokes, with a hole in the end of each, large enough to receive a 2 or 4 ounce cafe: each of thele fpokes may be 14 inches long from the block. Near the top of this block fix 8 more of the fame fpokes, exactly over the others, but not fo long by 2 inches. As this wheel is to run horizontally, all the cafes in the fpokes mult play obliquely upwards, and all thofe in the fpokes at bottom obliquely downwards. This being done, have a fmall horizontal wheel made with 8 fpokes, each 5 inches long from the block: on the top of this wheel place a cale of brilliant fire: all the cafes on this wheel muft play in an oblique dircetion downwards, and burn 2 at a time, and thofe on the large wheel 4 at a time; that is, 2 of thofe in the top fit of fookes, and 2 of thofe in the bottom fet of fpokes.

The 4 firlt cafes on the large wheel, and the 2 firft on the fmall, mult be fired at the fame time, and the brilliant fire at top at the beginning of the laft cafes. The cafes of the wheels may be filled with a grey charge. When thefe wheels are completed, you mult have a Atrong iron fpindle, made 4 feet 6 inches long, and fixed perpendicularly on the top of a Itand: on this put the large wheel, whofe nave mult have a hole quite through from the bottom to the top. This hole mult be large enough to turn eafy round the bottom of the fpindle, at which place there mult be a thoulder, to keep the wheel from touching the fland: at the ton of the fpindle put the fmall wheel, and join it to a large one with a leader, in order that they may be fired both to. gether.

## 93. Cafcades of Fire,

Are made of any fize; but one made according to the dimenfions of that fhown in fig. I. will be large enough for $8-0$. cafes. Let the diftance from $A$ to $B$ be 3 feet; frem $B$ to $C 2$ feet 6 inches; and from $C$ to $D$ 2 feet; and let the crofs piece at A be 4 feet long: then fromeach end of this picce draw a line to $D$; then make the other crofs pieces fo long as to come within thofe lines. The top piece D may be of any lengeth, fo as to hold the cafes, at a little diltance from each other; all the crofs pieces are fixed horizontally, and fupported by brackets; the bottom crofs piece fhould be about I foot 6 inches broad in the middle, the fecond 1 foot, the third 9 inches, and the top piece 4 incles: the cafes may be made of any length, but mult be filled with a brilliant charge. On the edges of the crofs pieces mult be railed bits of wood, with a groove cut in cach piece, large enough for a cafe to lie in. Thefe bits of wood are fixed fo as to incline downwards, and that the fire from one tier of cafes may play over the other. All the cafes being tied faft on, carry leaders from one to the other; and let there be a
pipe hung from the mouth of one of the cafes, covered of whece, at the end with a lingle paper, which you burn to fire exc. the catcade.
94. The Fire-Tres.

To make a fire-trec, as thewn by fig 2. you mult firt have a piece of wood 6 licet long, and 3 inches fquare ; thern at $\mathrm{E}, 9$ inches from the top, make a hole in the front, and in each fuate; or, inllead of holes, you may fix fhort pegs, to fit the infide of the cales. At F, 9 inches fiom E, fix 3 more pegs: at G, 1 foot 9 inches from F, fix 3 pegs; at $\mathrm{H}, 9$ inches from G , fix 3 pegs; at I , 9 inches from H , fix 3 pegs, inclining downwards; but all the other pegs mult incline upwards, that the cafes may have the fame inclination as you fee in the figure: then at top place a 4 -inch mortar, loaded with ftars, rains, or crackers. In the middle of this mortar place a cafe filled with any fort of charge, but let it be fircd with the other cafes: a brilliant charge will do for all the cales; but the mortar may be made of any diameter, and the tree of any fize; and on it any number of cafes, provided they are placed ia the manner defcribed.

## 95. Chinefe Fountains.

To make a Clinefe fountain, you muft have a perpendicular piece of wood 7 feet long and $2 \frac{1}{2}$ inches fquare. Sixteen inches from the top, fix on the front is crofs-piece 1 inch thick, and $2 \frac{1}{5}$ broad, with the broad fide up: below this, fix 3 more picces of the fame width and thicknefs, at 16 inches from each other: let the bottom rail be 5 feet long, and the others of fuch a length as to allow the fire-pumps to fland in the middle of the intervals of each other. The pyramid being thus made, fix in the holes made in the bottom rail 5 fire-pumps, at equal diltances; on the 2 d rail, place 4 pumps ; on the 3 d, 3 ; on the 4 th, 2 ; and on the top of the poft, 1 ; but place them all to incline a little forwards, that, when they throw out the flars, they may not ftrike againft the crofs ra:ls. Having fixed your fire-pumps, clothe them with leaders, fo that they may all be fired together. See fig. 3 .
96. Of Illuminated Globes with horizontal Wheels.

The hoops for thefe globes may be made of wood, tin, or iron wire, about 2 feet diameter. For a fingle globe take two hoops, and tie them together, one within the other, at right angles; then lave a horizontal wheel made, whofe diameter muft be a little wider than the globe, and its nave 6 inches long; on the top of which the globe is fixed, fo as to ftand 3 or 4 inches from the wheel: on this wheel you may put any number of cafes, filled with what charge you like; but let two of them burn at a time : they may be placed horizontally, or to incline downwards, juft as you choofe. Now, wheu the wheel is clothed, fix on the hoops as many iliuminations as will fand within $2 \frac{1}{2}$ inches of each other: thefe you faften on the hoops with fmall iron binding wire; and when they are all on, put on your pipes of communication, which mult be fo managed as to light them all with the 2 d or 3 d cafe on the wheel. The fipincle on which the globe is to run muft go through the block of the wheel, up to the infide of the top of the globe; where mult be fixed a bit of brafs, or iron, with a holc in it to receive the point of the fpindle, on which the whole weight of the wheel is to bear, as in fig. 4 . which reprefents a globe on its fpindle. By this method may be made a
of Whecls, crown, which is done by having the hoops bent in the form of a crown. Sometimes globes and crowns are ordered fo as to fand Atill, and the wheel only to turn rcund; but when you would have the globe or crown to ftand ftill, and the whel to run by itielf, the block of che wheel mutt not be folong, nor the fpindle any linger than to juft raife the globe a litile above the wheel; and the wheel cafes and illumination mut begin together.

## 97. Dodecatdron,

So called becaufe it nearly reprefents a twelve-fided figure, is made thus. Firft have a ball turned out of fome hard wood, 14 inches diameter: when done, divide its furface into 14 equal parts, from which bore holes it inch diameter, perpendicular to the centre, to that they may all meet in the middle: then let there be turned in the infide of each hole a female forew; and to all the holes but one, mult be made a round fpoke 5 feet long, with 4 inches of the fcrew at one end to fit the holes; then in the forew-end of all the fookes bore it hole, 5 inchics up, which mult be bored flumting, fo as to come out at one fide, a little above the ferew; from which cut a fmall groove along the fpoke, within 6 inches of the other ent, where you make another hole through to the other fide of the fpoke. Inthis end fix a fpindle, on which puta fmall wheel of 3 or 4 fides, each fide 6 or 7 inches long: thefe fides mult have grooves cut in them, large enough to receive a 2 or $40 \%$. cafe. When thefe wheels are clothed, put them on the fpindles, and at the end of each fpindle put a nut to keep the wheel from falling off. The wheels being thus fixed, carry a pipe from the mouth of the firit cafe on cach wheel, through the hole in the fide of the fpoke, and from thence along the groove, and through the other hole, fo as to hang out at the fcrew-end about an inch. The fpoles being all prepared in this manner, you mutt have a polt, on which you intend to fire the work, with an fron forew in the top of it, to fit one of the holes in the ball: on the forew fix the ball; then in the top hole of the ball put a little meal-powder, and fome loofe quick-match; then forew in all the fpokes; and in one dide of the ball bore a hole, in which put a leader, and fecure it at the end; and your work will be ready to be fired. By this leader the powder and match in the centre is fired, which will light the match at the ends of the fpokes all at once, whereby all the wheels will be lighted at once. There may be an addition to this piece, by fixing a fmall globe on each wheel, or one on the top wheel only. A grey charge will be proper for the wheel-cafes.
98. The Teru-tree of lrilliant Fire,

Is reprefented by fig. 5 . as it appears when burning. Firft, let A be an upright piece of wood, 4 feet long, 2 inclies broad, and 1 thick: at top of this piece, on the flat fide, fix a hoop 14 inches diameter; and round its edge and front place illuminations, and in the centre a 5 -pointed llar; then at $E$, which is $1 \frac{1}{7}$ foot from the edge of the hoop, place 2 cafes of brilliant fire, one on each fide: thefe cafes thould be ifoot long each: below thefe fix 2 more cafes of the fame fize, and at fuch a diftance, that their mouths may almoft meet them at top: then clote to the ends of thefe cafes fix 2 more of the lame cafes; they muit ftand parallel to them at E . The cafes being ihus fixed, clothe them with leaders; fo that they,
with the illuminations and Iturs at top, may all take fire of whe together.
92. Stars zuilh Points for regulated Pieces, \&ic.

Thefe fars are made of different fizes, according to the work for which they are intended: they are made with cafes from 1 oz , to 1 lb . but in general with 4 oz . cales, 4 or 5 inches long : the cales mult be rolled with pate, and twice as thick of paper as a rocket of the fame bore. Having rolled a cafe, pinch one end of it quite clofe: then drive in $\frac{1}{5}$ a diameter of clay; and when the cafe is dry, fill it with compof. tion, 2 or 3 inches to the length of the cafes with which it is to burn: at top of the charge drive fome clay; as the ends of theie cafes ane feltom pinched, they would be liable to take fire. Having filled a cafe, divide the circumference of it at the pinched end clofe to the clay into 5 equal parts; then bore 5 holes with a gimblet, about the fize of the neck of a common 4 oz. cafc, into the compofition: from one hole to the other carry a quick-match, and fecure it with paper: this paper mutt be put on in the manner of that on the ends of whee!-cafes, fo that the hollow part, which projects from the end of the cafe, may ferve to receive a leader from any other work, to give fire to the points of the ftars. Thefe ftars may be made with any numeber of points.
100. Fixed Sun auith a tranfparent Face.

To make a fun of the beff fort, there flould be two rows of cafes, as in fig. 6 . which will how a double glory, and make the rays ftrong and full. The frame, or fun-wheel, mult be made thus: Have a circular flat nave made very ftrong, 12 inches diameter: to this fix 6 itrong flat fpokes, A,B,C,D,E,F. On the front of thefe fix a circular fell, 5 feet diameter; within which fix ancther fell, the length of one of the fun-cafes leís in diameter; within this fix a 3 d fell, whofe diameter mult be lefs than the $2 d$ by the length of 1 cafe and 1.3d. The wheel being made, divide the fells into fo many equal parts as you would have cafes (which may be done from 24 to 44) : at each divifion fix a flat iron ftaple; thefe ftaples muit be made to fit the cafes, to hold them faft on the wheel; let the ftaples be fo placed, that one row of cafes may lie in the middle of the intervals of the other.

In the centre of the block of the fun drive a fpindle, on which put a fmall heragon wheel, whofe cafes mult be filled with the fame charge as the cafes of the finn : two caie, of this wheel muft burn at a time, and begin with them on the fells. Having fixed on all the cafes, carry pipes of communication from one to the other, as you lee in the figure, and from one fide of the fun to the wheel in the middle, and from thence to the orher fide of the fun. There leaders will hold the wheel fteady while the fun is fixing up, and will alfo be a fure method of lighting both cafes of the wheel together. A fun thus made is called a brilliant fun, becaufe the wood work is entirely covered with fire from the wheel in the middle, fo that there appears noulhing but farks of brilliant fire : but if you would have a tranfparent face in the centre, you mutt have one made of patteboard of any fize. The method of making a face is, by cutting out the eyes, nofe, and mouth, for the fparks of the wheel to appear through; but inftead of this face, you may have one painted on oiled preper, or Pcrfian fllk, ftrained tight on a hoop; which
ccls, which hoop mutt be fupported by 3 or 4 pieces of wire at 6 inches difence from the wheel in the centre, fo that the light of it may illuminate the face. By this method you may have, in the front of a fun, Vivar Rex, cut in pafteboard, or Apollo painted on filk ; but, for a fmall collection, a fun with a fingle glory, and a wheel in front, will be mof fuitable. Half-pound cafes, filled 10 inches with compofition, will be a good fize for a fon of 5 feet diameter; but, if larger, the cales muft be greater in proportion.
101. Three Vertical Whee's ilhurimated, which turn on their own Naves upon a borizon:al Tall.
A plan of this is flown by fig. 7. Let $D$ be a deal table 3 feet in diameter: this table muft be fixed horizontally on the top of a polt; on this polt mult be a perpendicular iron fpindle, which muft enme through the centre of the table : then let $\mathrm{A}, \mathrm{B}, \mathrm{C}, \mathrm{be}$ 3 fookes joined to a triangular flat piece of wood, in the middle of which make a hole to fit eafily over the fpindle: let E,F,G, be pieces of wood, 4 or 5 inches long each, and 2 inches fquare, fixed on the under fides of the fookes; in thefe pieces make holes lengthwife to receive the thin part of the blocks of the wheels, which, when in, are prevented from coming out by a fmall iron pin being rom through the end of each. K,L.M, are three vertical oftagon wheels, is inches diameter each: the blocks of thefe wheels mult be long enough for 3 or 4 inches to reft on the table ; round which part drive a number of fharp points of wire, which mut not project out of the blocks more than r-j6th of an inch: the ure of there points is, that, when the blocks run round, they will fick in the table, and help the whecls forward: if the naves are made of ftrong wood, one inch will be enough for the diameter of the thin part, which fhould be made to turn eafy in the holes in the pieces $\mathrm{E}, \mathrm{F}, \mathrm{G}$, On the front of the wheels make 4 or 5 circles of frong wire, or flat hoops, and tie on them as many illuminations as they will hold at 2 inches from each other: inftead of circles, you may make firal lines, clothed with illuminations, at the fame difance from each other as thofe on the hoops. When illuminations are fixed on a fpiral line in the front of a wheel, they moft be placed a little on the flant, the contrary way that the wheel suns: the cafes for thefe wheels may be filled with any coloured charge, but mult burn only one at a time.

The wheels being thus prepared, you mult have a globe, crown, or firal wheel, to put on the findle in the middle of the table: this fpindle thould be juft lnng enourh to raife the wheel of the globe, crown, or fpiral wheel, fo high that its fire may play over the 3 vertical wheels: by this means their fires will not be confufed, nor will the wheels receive any damage from the fire of each other. In clothing this work, let the leaders be fo managed, that all the wheels may light together, and the illuminations after 2 cales of each wheel are burned.

## 102. Illuninated Chandelier.

Illuminated works are much admired by the Italians, and indeed are a great ajdition to a collection of works: in a grand exhibition an illuminated piece fhould be fired after every two or three wheels, or fixed pieces of common and brilliant fires; and likewife illuminated works may be made cheap, quick, and ealy.
 have cne made of thin word (fic fig. 8.) The chann. \&e. delier being made, bore in the eront of the branches, and in the body, and allo in the crown at top, as many holes for illuminations as they will contain at 3 inches difance from each other: in thefe heles put illuminations filled with white, hlue, or brilliant charge. liasring lixed in the port-fires, clothe them wit. leadors, fo that the chandelier and crown may light together. The fmall circles on this figure reprefent the mouths of the illuminations, which mult project Atraight from the front.

## 103. Illuminated 2 inu Tiee.

Firt have a tree made of wood, fuch as is fhown by fig. 9. The middle piece or ftem, on which the hranches arc fixed, muft be 8 feet 6 inches high : at the bol. tom of this piece draw a line, at right angles, 2 feet $\sigma$ inches long at each fide ; then from $L$, which is 1 loot 6 inches from the bottom, draw a line on eath fice to C and D : thefe lines will give the length of the two firft branches. Then put on the two top branches parallel to them at bottom: let the length of each of thefe branches be 1 foot from the flem: from the ends of thefe two branches draw a line to C and D : then fix on 5 more brarehes at an equal diflance from each nther, and their length will be determined by the lines $A C$ and ED. When the branches are fixed, place i)luminating portfires on the tup of each, as many as you choofe: behind the top of the Item falten a gerbe or white fountain, which muft be fired at the begiming of the illuminations on the tree.
104. Flaming Stars wuid's brilliant Wheels.

To make a flaming ftar, you mult firft bave made a circular piece of flrong wood about i inch thick and 2 feet diameter: round this block fir 8 pointc, 2 feet $G$ inches long each ; 4 of thefe points mult be ftraight and $\&$ flaming: thefe points being joined on very frong, and even with the furface of the block, nail tin or pa\&eboard on their edges, from the block to the end of each, where they mult be jcined : this tin muft project in front 8 inches, and be joined where they meet at the bloek; round the front of the bloek lix 4 pieces of thick iron wire, 8 inches long each, equally diftant from each other: this being dene, cut a piece of pafteboard round, 2 feet diameter, and draw on it a far, as may be feen in fig. 10. Cut out this far, and on the back of it palt: oiled paper; then paint each point half red and half yellow, lengthwife ; but the body of the far mult be lett open, wherein muft run a brilliant wheel, made thus: Have a light block turned 9 inches long: at each end of it fix 6 fpokes; at the end of each fonke put a 2 nunce cafe of brilliant fire: the length of thefe cafes mult be in proportion to the wheel, and the dia. meter of the wheel when the cafes are on mult be a little lefs than the diameter of the body of the frall ftar: the cafes on the fpokes in front meft have their months incline outwards, and thofe on the infide fookes mull be placed fo as to form a vertical citcle of fire. When you place your lcaders, earry the firft pipe from the tail of 1 of the eafes in front to the mouth of 1 of the influc cafes, and from the tail of that to another in front, and fo on to all the cafes. Your wheel being made, put it on a fpindle, in the centre of the far; this fpindle mult have a fhoulder at bottom, to keep the wheel at a lielc diftance from the block. This wheel munt be kepe on

Of Wheets, the fpindle by a nit at the chd ; laving fixed on the wheel, fathen the tranfparent fiar to the + pieces of wire : when you fite it, you will only fee a common horizontal wheel; but when the fiff care is bumt out, it will fire one of the vettical cales, which will thow the trant: parent far, and fill the large flames and points with fire; then it will again appear like a common wheel, and fo on for 12 changes.
105. Projicted regulated Piece of nime Mutions.

A regrilated piece, if well exceuted, is as curious as any in tire-works: it confifts of fixed and moveable pieces on one fipindle, reprefenting various figures, whel take fire fitecefively one from another, without any affifance after lighting the firft mutation. See lig. ${ }^{11}$.
I. Numes of the mutations, with the colour of fire and fize of the cales belonging to each.

Eirft muitatios is a hexagon vertical wheel, illuminated in front with fmall portfires tied on the fpokes; this wheel muft be elothed with 2 ounce eafes, filled with black charge; the length of thefe cafes is determined by the fize of the whecl, but mult burn fingly.

Secomel anntation is a fixed pieee, ealled a golden glory, by reafon of the eafes being filled with fpur-fire. The cafes mut fand ferpendicular to the block on which they are fixed, fo that, when burning, they may reprefent a glory of fire. This mutation is generally compofed of 5 or 7 two ounce cafes.

Thirl mutation is moveable; and is only an octagon rertical wheel, clothed with 4 ounce cafes, filled with billiant charge: 2 of thefe eafes muft burn at a time. In this wheel you may make ehanges of fire.

Fourth mutation, is a fixed fun of brilliant fire, confilling of 12 four ounce cafes: the neeks of thefe eafes muft be a little larger than thofe of 4 ounce wheelcafes. In this mutation may be made a change of fire, by filling the cafes half with brilliant charge, and half with grey.

Fifib inutation, is a fixed piece, called the porcupine's quills. This piece confifts of 12 fpokes, flanding perpendicular to the block in which they are fixed; on each of thefe fpokes, near the end, muft be plaeed a 4 ounce eafe of brilliant fire. All thefe cafes muft incline either to the right or left, fo that they may all play oric way.

Sixth mutation, is a fanding piece, called the crofsfire. This mutation confifts of 8 fpokes fixed in a !lock; wear the end of each of thofe fookes mult be tied two 4 ounce cafes of white charge, one acrofs the other, fo that the fires from the cafes on one fpoke may interfect the fire from the eafes on the other.

Scoentb mutation, is a fixed wheel, with 2 cireular fells, on which are placed 16 eight-ounce eafes of brilliant fire, in the form of a ftar. This piecc is called a fixed flar of willd fire.

Eighth mutation. This is a beautiful piece, called a brilliunt flar-piece. It contifts of 6 fpokes, which are firengthened by 2 fells of a hexagon form, at fome diAance from caeh other: at the end of each fpoke, in the front, is fixed a brilliant Aar of 5 points; and on each fide of every flar is placed a 4 ounce eafe of black or grey charge; thefe cafes muft he placed with their mouths fidewife, so that their fires may crols cach other.

Ninth mutation, is a wheel-pisce. This is compofed of of 6 long fpekes, with a liexagon vertical wheel at the \&o end of each; thefe wheels rum on findles in the front of the fpokes; all the wheels are lighted together: 2 ounce cafes will do for thefe wheels, and may be filled with any colsured charge.
II. Proportions of the mutations, with the method of conveying the fire from one to the other, and the diftanee they ftand one from the other on the finindle.

Firft Mutation, mult be a hesagon vertical wheel, I4 inches diameter; on one fide of the block, whofe diameter is $2 \frac{1}{4}$ inches, is fixed a tin barrel A (fee fig. ir. $\mathrm{n}^{\circ}$ r.) This barrel mult be a little !efs in diameter than the nave; let the length of the barrel and bloek be 6 inehes. Having fixed the cates on the wheel, carry a leader from the tail of the latt cafe in. to the tin barrel through a hole made on purpofe, 2 inches from the block; at the end of this leader let there be about I inch or 2 of loofe match; but take eare to fecure well the hole wherein the pipe is put, to prevent any fparks falling in, which would light the fecond mutation before its time, and confufe the whole.

Second mutation is thus made. Have a nave turned $2 \frac{7}{\frac{1}{2}}$ inches diameter, and 3 long; then let $\frac{1}{2}$ an inch of that end which faces the firlt wheel be turned fo as to fit eafy into the tin barrel of the firft mutation, which. muft turn round it without touching. On the other end of the block fix a tin barrel $B, n^{\circ}{ }_{2}$. This barrel muit be 6 inches long, and only half an inch of it to fit on the block. Round the nave fix 5 fpokes, $1 \frac{1}{2}$ ineh long each ; the diameter of the fpokes mult be equal to a 2 oz . former. On thefe fpokes put five 7 -inch 2 oz . cafes of fpur-fire, and earry leaders from the mouth of one to the other, that they may all light together. Then from the month of one of the cafes carry a leader through a hole bored flantwife in the nave, from between the fpokes, to the front of the block near the findle hole: the end of this leader mult project out of the hole into the barrel of the firf mutation, fo that when the pipe which comes from the end of the laft cafe on the firft wheel flathes, it may take fire, and light the ad mutation. To communicate the fire to the 3 d mutation, bore a hole near the bottom of one of the 5 cafes to the compofition, and from thence carry a leader into a holc made in the middle of the barrel B : this hole muft be covered with pafted paper.

Third mutation, may be either an octagon or hexagon wheel, 20 inches diameter; let the nave be $3 \frac{2}{3}$ inches diameter, and $3^{\frac{1}{2}}$ in length; $1 \frac{1}{2}$ inch of the front of the nave mult be made to fit in the barrel B . On the other end of the block fix a tin barrel $\mathrm{C}, \mathrm{n}^{\circ} 3$. This barrel mult be $6 \frac{1}{t}$ inches in length, one incl of which mult fit over the block. The eafes of this whecl mult burn 2 at a time; and frons the mouths of the 2 firit eafes earry a leader, through holes in the nave, into the barrel of the fecond mutation, after the ufual manner : but befides theie leaders let a pipe go acrofs the wheel from one firt eafe to the other; then from the tail of one of the laft eafes carry a pipe into a hole in the middle of the barrel C : at the end of this pipe let there be fome loofe quick match.

Fourth and ffth mutations. Thefe may be defcribed under
efs, under one heti, as their naves are made of one ficce, which from E to F is $1+$ inches; E, a block 4 inches diameter, with 10 or 12 fiort fpokes, on which are fixed 1 -inch E-oz. cafes: let the front of this block be made to fit cafy in the barrel C , and cloth: the cates fo that they may all light together; and let a pipe be carried through a hole in the block into the barrel C , in order to receive the fire from the leader brought from the late cafe on the wheel. $G$ is the mave of the 5 :h mution, whofe diameter muft be 4 : inclies: in this nave fix 10 or 12 fpoles, if foot in length euch; thefe fipokes mult fland 7 inches dillant from the fpokes of the $4^{\text {th }}$ mutation; and at the end of each fooke tie a 4-uz. cafe, as $n^{\circ}$ 5. All thefe cales are to be lighted togeiher, by a leader brought from the end of one of the cafes on $n^{\circ} 4$. Let F atid H be of the fame piece of wood as $E$ and $G$, but as much thinner as pollible, to make the work light.

Sixib and fiventib matations. The blocks of thefe 2 mutations are turned out of one piece of wood, whofe length from F to $P$ is 15 inches. L, a block 5 inclies diameter, in which are fixed 8 fopoes, each 2 feet 4 inches long; at the end of each fpoke tie two 4.0 z . cafes, as $n^{\circ} 6$. All thefe cafes mult be nired at the fame time, by a pipe brought from the end of one of the cafss on the 5 th mutation. Let the diftance between the fpokes at L., and thofe in the 5 th mutation, be 7 inches. M, the nave of the 7 th mutation, whofe diameter muft be $5 \div$ inches: in this nave fix 8 fpokes, and on the front of them 2 circular fells, one of 4 feet 8 inches diameter, and one of 3 feet in diameter; on theie fells tie 168 -oz. or pound cales, as in $n^{\circ} 7$. and carry leaders from one to the other, fo that they may be all fired together. This mutation mult be fired by a leader brought from the tail of one of the cafes on the 6th mutation.

Eighth and ninth mutations. The blocks of thefe may be turned out of one piece, whore length from $P$ to D mult be 12 inches. $O$, the block of the 8 th mutation, which muft be 6 inches diameter ; and in it mult be fixed 6 fpokes, each 3 feet in length, ftrengthened by an hexagon fell within 3 or 4 inches of the ends of the fpokes: clofe to the end of each fpoke, in the front, fix a five-pointed brilliant far; then 7 inches below each flar tie two to inch 8 oz. cafes, fo that the upper ends of the cafes may reff on the fel!s, and their ends on the fipokes. Each of thefe cafes mult be placed parallel to the oppofite fell (fee $n^{\circ} \mathrm{s}$.) NNN , \&c. are the cafes, and thk, \&c. the flars.
The gth mutation is thus made. Let D be a bleck 7 inches diameter. In this block mult be ferewed 6 tpokes, 6 feet long each, with holes and grooves for leaders, as thofc in the dodecaedron; at the end of cach fooke, in the front, fix a fyindle for a hexagon vertical wheel, 10 inches diameter, as in $n^{\circ} 9$. Whien thefe whee's are on, carry a leader from each into the hleck, fo that they may all meet; then lead a pipe from the end of une ot the cafes of the Sth mutation, through a hole bored in the block D , to meet the leaders fion the vertical wheels, fo that they may all be fired together.
The f pindles for larger pieces are required to be made very flrong, and as exact as polfible : for a piece of 9 mutations, let the fpindle be at the large end is inch diameter, and continue that thiclones as far as the

7ho mutation ; and therece to the 5 th, lee its ch:ameter of Whects, be $\frac{3}{4}$ of an inch; frum the 5 th to the 4 th, 5 -保h of ${ }^{\text {cice }}$ an inch; from the fth to the $2 d$, inch; and fiom the $2 d$ to the end, 3 -Sthe of an inch. At the finall and mult be a nut to heep on the firll wheel, and at the thick end mult be a large mut, as flown by the figure ; fo that the forew part of the findie being put through ap polt, and at mut ferewed on tight, the firisdl: will be held fatt and deady: but yon are to obiferve, that that part of the fpinule on whel the moveabi: pieces are to run, be nade long enourgh for the whecis to run eafy without flicking ; the fixed pieces beinion made on difierent blocks, the leaders mult be joincd, after they are fixed on the fpindle. The bet method of preventing the fixed nutitions from moving on the findle, is to make that part of the fpindle whith gees through them fquare; inut as it would be dificuis to male fquare holes through fuch long tlocks ats are fonmetinues required, it will be befl to mate them thus: Bore a hele a little larger than the diameter of the fpindle; and at cach end of the blocli, over the hole, faften a piece of brafs with a fquare liole in it to fit the fpindle.
1c6. To make ant Horizontal Wheel chanse to a Verticul $W$ beed with a Sun in fromt.
The fudden change of this piece is very pleafing ; and grives gueat furprife to thote who are bot acquaint a ed with the cortrivance. A wheel for this purpofe fhruld be about three feet diamcter, and is fell circulat; on which tie 16 half pound eafes fuled with brilv liant charge: two of thefe cites mutt bun at a time and on each end of the nave muft be a tin harrel ut the fame conftruction as thofe on the regulated piece. The wheel being completed, prepare the polt or tand thus: Firf have a ftatd made of any height, about three or four inches fquare; then faw off from the top a piece two feet long; this piece join argain at the place where it was cut, with a binge on ore fide, fo that it may lift up and down in the fiont of the ftand: then fix on the top of the bottom-part of the fland, on each fide, a bracket; which bracket mult project at right angles with the ftand, one foot fr. m the front, for the fhort piece to reft en. Thefe brackets mult be playced a little above the joint of the poft, fo that when the upper ftand falls, it may lie betueen them at right angles with the bottom ftand; which may be done by fixing a piece of wood, one foot long, between the brackets, and even with the top of the bettom fland; then, as the brackets sife above the bottom fand, they will form a channel for the fort poit to lie in, and kcej) it fendy without fraining the hinge. On the fide of the fhort pott, oppofite the hinge, naill a picce of wood, of fuch a length, that, when the polt is perpendienlar, it may reach about $1 \frac{1}{f}$ feet down the long poit; to which being tied, it will hold the flort ftand uptight. The fand being thus prepared, in the top of it fix : fpindle 10 inches longr: on this fpindle put the wheel: then fix on a brilliant fun with a fingle glory; the didmeter of this fun muft be 6 inclies lefs than that of the wheel. When you fire this piecc, light the wheel firf, and let it sun horizontally till four caie, are cenfumed: then from the end of the fourth cafe carry it leader into the tin baryel that turns over the end of the fand: this leader muft be met by another broaght through the top of the polt, from a cafe blled with a fromy
of Whels，port－fire charge，ard tied to the botion polt，with its mouth facing the packthread which holds up the ftand ；fo that when this cafe is lighted，it will burn the packthread，and let the wheel fall forwasd，by which means it will Lccome vertical：then from the lat cafe of the wheel，carry a leader into the Earrel noxt the ftan，which will begin as foon as the whed is burnt nut．
10\％．Crand Iolute illuminated with a projated Whee！in front．
Firft have two hoops inade of frong iron wire，one of 6 feet diameter，and one of $\&$ feet 2 inches；thefe hoops muft be joined to ferolls $A, A, A, \& c$ ．as in fig．I．Thefe ferolls mull be made of the fame fort of wire as the hoops；on thefe fcrolls tie，with inon－
binding wire，as many illuminating port－hres as they will hold，at two inches diftance ；clothe thefe port－fires with leaders，fo that they may all take fire together．－ Then let C be a circular wheel of four fpokes， 3 feet 6 inches diameter；and on its fell tic as many $4-0$ ．cafes， licad to tail，as will complete the circle，only allowing a finfficient ditance between the cafes，that the fire may pafs free；which may be done by cutting the upper part of the end of each cafe a little thelving：on each fpoke fix a $4-0 \mathrm{z}$ ．cafe，about three inches from the fell of the wheel：thefe cafes are to burn one at a time，and the firf of them to begin with thofe on the fell，of which four are to burn at a time；fo that the wheel will latt no long－ er than $\frac{1}{4}$ of the cafes on the fell，which in number thould be 16 or 20 ．On the front of the wheel form a fpiral line with farong wire，on which tie port－fires， placing them on a flant，with their mouths to face the fame way as the cafes on the wheel：all thefe port－fires muft be fired with the fecond calcs of the wheel．Let $\mathrm{I}, \mathrm{D}, \mathrm{D}$, \＆c．be fpokes of wood，all made to fcrew into a block in the centre；each of thefe fookes may be in length about 4 feet 6 inches；in the top of each fix a fpindle，and on each fpindle put a fpiral wheel of 8 fpokes，fuch as E，E，E，\＆c．The blocks of thefe wheels mult have a hole at top for the centre cafes， and the fpindle mutt have nuts frewed on their ends； which mits thould fit in the holes at top of the blocks， fo that all the wheels mult be put on before you fix in the centre cafes：as fome of there whecls，by reafon of their fituation，will not bear on the nut，it will be ne－ celiary to have fmooth houlders made on the fpindles for the blocks to 1 un on．The cafes of thefe wheels are to burn double；and the method of firing them，is by carrying a leader from each down the fpokes into the block in the centre，as in the dodecaedron，but the centre cafe of each wheel muft begin with the two laft cates as ufual．It is to be obferved，that the large cir－ cular wheel in front muit hare a tin barrel on its block， into which a pipe mult be carried from one of the fe－ cond cafes on the wheel；this pipe being met by ano－ ther from the large block，in which the 8 fpokes are forewed，will fre all the fpiral wheels and the illumi－ nating port－6res at the fame time．The cafes of the projected wheel may be filled with a white charge，and thate of the firial wheels with a grey．

## 108．Moon and Seven Stars．

Let fig．2．be a fmooth circular board 6 feet dia－ meter：out of the middle of it cut a circular piece 12 or 14 inches diameter；and over the vacancy put white Perfian filk，on which paint a moon＇s facs：then let

E C H N Y．
I，T，I，\＆ic．be ftars，each 4 or 5 inches dinmater，cut of out with five points，and covered with oiled filk：on \＆c． the front of the large circular bozre draw a 7 －pointed far，as large as the circle will allow；then on the lines which form this ftar，bore holes，wherein fix peinted nars．When this cafe is to be fired，it mult be fixed upon the front of a polt，on a finindle，with a wheel of brilliant fire behind the face of the moon：fo that， while the wheel burns，the moon and ftars will appear tranparent：and when the wheel has burnt out，they wiil difappear，and the large ftar in front，which is form－ ed of pointed ftars，will begin，being lighted by a pipe of communication from the laft cafe of the vertical wheel，behind the moon；this pipe mult be managed in the fame manner as thofe in regulated pieces．

109．Double Cons．Wheelilluminated．
This piece is reprefented by fig．3．Let $\mathbf{A}$ be a ftrong decagon wheel， 2 feet 6 inches diameter；then on each fide of it fix a cone B and C ：thefe cones are to confint of a number of hoops，fupported by 3 or 4 pieces of wood，in the manner of the firal wheels．Let the height of each cone be 3 feet 6 inches；and on all the hoops tie port－fires horizontally，with their mouths outwards，and clothe the wheel with 8 －oz．cafes，all to play horizontally，two at a time：the cones may be ti－ red with the firt or fecond cafes．The fpindle for this piece muft go through both the cones，and rife three feet above the point of the cone at top；fo that its length will be io feet 4 inches from the top of the pois $H$ ，in which it is fixed，allowing four inches for the thirknefs of the block of the wheel．The whole weight of the wheel and cones mult bear on a houlder in the fpindle，on which the block of the wheel mult turn．－ Near the top of the fpindle mutt be a hole in the front， into which fcrew a fmall fpindle，after the cones are on： then on this fmall fpindle fix a fun $D$ ，compofed of fix－ teen 9 －inch $4-\mathrm{oz}$ ．cades of brilliant fire；which cafes mult not be placed on a fell，but only ftuck into a block of 6 inches diameter ：then in the front of this fun muft be a circular vertical wheel， 16 inches diameter；on the front of this wheel form with iron－wire a fpiral line， and clothe it with illuminations after the ufual method． As this wheel is not to be fired till the cones are burnt out，the method of firing it is thus：Let the hole in the block，at the top of the uppermoft cone，be a little lar－ ger than the fpindle which paffes through it．Then， from the firit cafe of the vertical wheel before the fun，carry a leader down the fide of the fpindle to the top of the block of the horizontal wheel，on which mult be a tin barrel：then this leader being met by another brought fiom the end of the latt cafe of the horizontal wheel，will give fire to the vertical wheel fo foon as the cones are extinguifled：but the fun D muft not be fired till the vertical wheel is quise buint cut．

## 110．Fire－pumps．

Cafes for fire－pumps are made as thofe for tourbil－ lons；only they are pafted，inftead of being rolled dry． Having rolled and dried your cales，fill them：firt put in a little meal－powder，and then a far；on which ram lightly a ladle or twe of compofition，then a little meal． powder，and on that a ftar，then again compofition； and fo no till you have filled the cate．Stars for firc－ pumps thould not be round；but muft be made either fquare，or flat and circular，with a hole through the middle：
middle : the quantity of powder for throwing the Rars muft increafe as you come near the top of the cafe; for, if much powder be put at the botom, it will burf the cafc. 'The fars mult diffici in fize int this manner: Let the ftar which you put in firt be about $\frac{1}{4}$ lefs than the bore of the care; but let the next far be a little larger, and the third fitar a little larger than the fecond, and fo on: let them increafe in diameter till withein two of the top of the cafe, which two mult fit in tiglit. As the loading of fire-pumps is fomewhat dificult, it will be neceflary to make two or three trials belac you depend on their pefformance: when you till a number of fumps, take eare not to put in each an equal quantity of charge between the Aars, to that when they are fired, they may not throw up too many fitars together. Cates for liee-pumps thould be made vely ftrong, and rolled on for $\$ \mathbf{o z}$. furmers, 10 or 12 inches long each.

## 111. Virtical Siroll IWhech.

This wheel may be made of any dimmeter, but mutt
Plate be contructed as in fig. 4 , to do which proceed thus: sccexxx. Have a block made of a moderate tize, in which fix four flat fpokes, and on them fix a flat circular fell of wood; round the front of this tell place port-nres; then on the front of the fpokes furm a icr il, either with a ho. $p$ or Itrong iron wite; on this fito.l the cates of brilliant fire, in proportion to the wheel, head to tail, as in the $\tilde{f}_{0}$ ure. When you fire this whecl, light the firlt cale near the fell ; then, as the cales fire fucceliively, you will tee the circle of fire gradudlly dinmith: but whethet the ilumi ations on the tell begin with the feroll or not, is immaterial, that being left entirely to the maker.
$N . B$. This wheel may be put in the front of a regrulated piece, or fired by itlelt, occafionally. 112, Pin-/I hecls.
Firlt roll fome paper pipes, about fourteen incles long each; theie pipes muft nit be made thick of paper, two or three rounds of elephant paper being fuficient. When your pipes are thoroughly dried, you mult have a tin tube 12 inches long, to fit eaty into the pipes; at one end of this tube bix a fmall conical cup, which cone is called a funne.; then bend one end of one of the pipes, and put the funnel in at the other as far as it will reach, and fill the cup with compofition: then draw out the funnel by a little at a time, fhaking it up and down, and it will fill the pipe as it comes ont. Having filled fome pipes, have fome fmall blocks made about one inch diameter and half an inch thick: round one of thefe blocks wind and pafte a pipe, and to the end of this pipe join another ; which muit be done by twitting the end of one pipe to a point, and putting it into the end of the other with a little palte: in this manner join four or five pipes, winding them one upon the other fo as to form a piral line. Having wound on your pipes, patte twe flips of paper acrofs them to hold them together: befides thefe flips of paper, the pipes mult be pafted together.

There is another method of making thefe wheels, viz. by winding on the pipes without palte, and fick: ing them together with fealing-wax at every half turn; fo that when they are fired, the end will fall loofe every time the fire paffes the wax, by which means the circle of fre will be confiderably increafed. The formers for thefe pipes are made from $I=$ to $4-16$ ths of an inch VoL, XV.
diameter; and the compofition forthem is as foliows: Menl-powder 8 o\%. faltpetre 2 oz. and fulplur 1 : among thefe ingredients may be mixed a little Acc!filings or the dull of caft iron : this compofition thould be very dry, and not made too fine, or it will ftick in the famel. Theie wheels may be fircd on a large pin, and held in the hand with fatety. 113. Firerglabes.

There are two forts of fire-globes; one with proJeftere cates ; the other with the calces concealed, thins: Have a glove made of wood, of any diancter you
choofs, and divide the furface of it into $1+$ equal pats, Have a globe made of wood, of any diancter you
choofe, and divide the furface of it into it equal patis, and at each divifion bore a hole perpendicular to the centre : thete holes muft be in proportion to the cafes intended to be ufed: in every hole except one, put a
cafe filled with brilliant, or any other charge, and let intended to be ufed: in every hole except one, put a
cafe filled with brilliant, or any other charge, and let the mouths of the cales be even with the furface of the globe ; then cut in the globe a gronve, from the month globe; then cut in the globe a gronve, from the month
of one cale to the other, for leaders, which mult be carried from cafe to cafe, fo that they may all be fired
together ; this done, cover the globe with a fingle pacarried from cale to cafe, fo that they may all be fired per, and paint it. Thele globes may be ufed to ornament a building.

Fire-globes with projected cafes are made thus: Ynur globe being made with 44 holes bored in it as ufud, fix in every hole except one, a cafe, and let each cafe project from the globe two-thirds of its length;
then clothe all the cafes with leaders, fo that they may cate project from the globe two-thirds of its length;
then clothe all the cafes with leaders, fo that they may all take fire at the fame time. Fire-globes are fupported by a pintle, made to fit the hole in which there is no cafe.
114. To thread and joiz: Leaders, and place thens on different Works.
Joining and placing leaders is a very effential part of fire works, as it is on the leaders that the performance of all complex works depends; for which reafon the method of conducting pipes of commanic ation flall the method of conducting pipes of commanic ation frall works being ready to be clothed, proceed thus: Cut your pipes of a fulficient length to reach from one cale to the
other; then put in the quick-match, which mult alwaws pipes of a fulficient length to reach from one cafe to the
other ; then put in the quick-match, which mult always be made to go in very enfy: when the match is in, cut it off within about an inch of the end of the pipe, and let it projest as much at the other end; then faften the pipe to the muth of each cale with a pin, and put the loofe ends of the match into the months of the cafes, the loofe ends of the match into the mouths of the cafes,
with a litie meal-powder : this done to all the cafes, pafte over the mouth of each two or three bits of paper. The preceding method is ufed for large cafes, and the
following for finall, and for illuminations: Firft thread The preceding method is ufed for large cafes, and the
following for fmall, and for illuminations: Firft thread a long pipe; then lay it on the tops of the cales, and cut a bit of the under fide, over the mouth of each cafc,
fo that the natch may appear: then pin the pipe to fo that the match may appear: then pin the pipe to every other cafe; but before you put on the pipes, pat a littie meal-powder in the mouth of each cafe. If the cafes thus clothed are port-fires on illuminated works, cover the mouth of each cafe with a fingle paper; but if they are choaked cales, fituated fo that a number of
fparks from other works may fall on them before they fparks from other works may fall on them before they are fired, fecure them with three or four papers, which muf be palted on very fmooth, that there may be no creafes for the fparks to lodge in, which often fet fire to the works before their time. Avoid as much as poffible placing the leaders too near, or one acrofs the ctier fo as to touch, as it may happen that the flafh of one $4 X$
will Your globe being made with cares are made thus: ferent Works.

Different bieces of Xire-works
will fire the other ; therefore if your works fhould be fo formed that the leaders mult rrofs or touch, be fure to make then very flrong, and fecure at the joints, and at every opening.

When a great length of pipe is required, it muft be made by joining feveral pipes in this manner: Having put on one length of match as many pipes as it will hold, pafte paper over every joint ; but, if a flill greater length is required, more pipes muft be joined, by cutting about an inch off one fide of each pipe near the end, and laying the quick-match tngether, and tying them faft with frnall twine; after which, cover the joining with palled paper.

## 115. Placing Fire-works to be exbibited.

Nothing adds more to the appearance of fire-works than the placing them propely; though the manner of placing them chiefly depends on the judgment of the maker. The following are the rules generally obferved, whether the works are to be fired on a building or on ftands: If they are a double fer, place one whecl of a fort on each fide of the building; and next to each of them, towards the centre, place a fixed piece, then wheels, and fo on; leaving a fufficient diftance between them for the fire to play from one without burning the other. Having fixed fome of your works thus in frunt, place the reft behind them, in the centre of their intervals: The largeft piece, which is generally a regulated or tranfparent piece, munt be placed in the centre of the building, and behind it a fun, which muit always fland above all the other works: A little before the building, or ftands, place your large gerbes; and at the back of the works fix your marron batteries, pots des aivertes, pots des brins, pols des faucifons, air-balloons, and flights of rockets: The rocket itands may be fixed beliind, or anywhcre elfe, fo as not to be in the way of the works.

Single collections are fired on ftands; which flands are made in the fame manncr as theodolite flands, only the top part muft be long or fhort occafionally: thefe flands may be fixed up very foon without much trouble.

[^6]E C H N Y.
Sect. V.
23. Two $\left\{\begin{array}{l}\text { Fruiloni wheels }\end{array}\right.$
24. Two $\{$ illuminated globes with horizontal whecls
25. One pot des faucifions
26. Two plural wheels
27. Marron battery
28. Two chandeliers illuminated
29. Range of pots des brins
30. Twelve n y-rockets
31. Two yew-trees of fire
32. Neft of ferpents
33. Two double cones illuminated
34. Regulating piece of feven mutations, viz.

1. Vertical wheel illuminated
2. Gonlden glory
3. Oftagon vertical wheel
4. Porcupine's quills
5. Crofs fires
6. Star-piece with brilliant rays
7. Six vertical wheels
8. Brilliant fun
9. Large fight of rockets.

When water-works are to be exhibited, divide them into feveral fet, and fire one fet after every fifth or fixth change of land and air-works. Obferve this rule in firing a double fet of works: Always begin with fky rockets, then two moveable pieces, then two fixed pieces, and foon; ending with a large flight of rockets, or a marron battery: if a fingle collection, fire a fixed piece after every wheel or two, and now and then fome air and water-works.

## 117. Fountain of Sky-rockets.

Fig. 5. reprefents a funtain of 30 rockets. Let Plate A be a perpendicular poit, is feet high from the ccecexxxtground, and 4 inches fquare. Let the rail, or crofs piece C, be 1 foot 6 inches long, 3 inches broad, and 1 thick. The rail D , at bottom, mult be 6 feet long, I foot broad, and 1 inch thick. $F$ and $G$ are the two fides which ferve to fupply the rails $\mathrm{D}, \mathrm{E}$, H, I, C : thefe fides are 1 foot broad at bottom, and cut in the front with a regular flope, to 3 inches at top: but their back edges mult be parallel with the front of the pots A . The breadth of the rails $\mathrm{E}, \mathrm{H}, \mathrm{I}$, will be determined by the breadth of the fides: all the rails muft be fixed at 2 feet diftance from each other, and at right angles with the pots. Having placed the rails thus, bore in the bottom rail to holes, at equal diftances, large enough to receive the fick of a one-pound rocket : in the back edge of this rail cut a groove from one end to the other, fit to contain a quick-match; then cut a groove in the top of the rail, from the edge of each hole, into the groove in the back: in the fame manner cut in the fecond rail, E, 8 holes and grooves; in the third rail, $\mathrm{H}, 6$ holes and grooves; in the fourth rail, 1,4 holes and grooves; and in the top rail, 2 holes and grooves. B, a rail with holes in it to guide the ends of the socket-ficks : this rail mult be fixed 6 feer from the rail D. The fountain frame being thus made, prepare your rockets thus: Tie round the mouth of each a pece of thin paper, large enough to go twice round, and to project alrout $x \frac{1}{2}$ inch from the mouth of the rocket, which mult be rubbed with wet meal-powder; in the month of each rocket put a leader, which fecure well with the paper that projects from the mouth of the case : thefe leaders mult be carried into the grooves
in the back of the rails, in which lay a quick-match from one end to the other, and cover it with palled paper : holes mutt be made in the raii D , to receive the ends of the llicks of the rockers in the rail E , and fo on to the fourth rail; fo that the ficks of the rockets at top will go through all the rails. The rockets being fo prepared, fix a gerbe, or white flower-pot, on edch rail, before the poft, with their mouths inclining is little forwards: thefegerbes mult be lighted all at once. Behind or before each gerbe, fix a cafe of brilliant or flow fire: thefe cafes mult be filled fo that they may burn out one after the other, to regulate the fumtain; which may be donc by carrying a leader frem the end of each flow or brilliant fire, into the groove in the back of each rail. Different fixed rockets may be uled in thefe foun. tains: but it will be beft to fill the heads of the rockets on each rail with different forts of things, in this manner; thofe at top with crackers, the next wit. rains, the third with ferpents, the fourth with tailed Atars, and the latt flight with common or brilliant ftars.

## 1i8. Palm Tree.

This piece, though made of common fires, and of a fimple conflruttion, has a very pleating effest ; owing to the fires interfecting fo often, that they refemble the branches of trees. Let A (fig. 6.) be a perpendicular pol?, of any thicknefs, fo that it is fufficiently flrong to hold the cafes; let the dillance from B to C be 2 feet 6 inches, and $C$ to $D 2$ feet 6 inches, and let the length of each crois piece be 2 feet; on each end of each fix a five pointed ftar: then fix, on pegs made on purpofe, 12 inch balf pound cafes of brilii:unt fire, as in the figure. All the cafes and ftars mut be fired at once. This piece fhuuld be fixed high from the ground.
119. Illuninated Pyramid, withs Arclimedian Serews, a Globe, and verrical Sun,
May be of any fize. One made according to the dimentions of fig 7. will be a goud proportion, whote height is 2 I feet; from C to $\mathrm{D}, 6$ feet; from E to F , 9 feet: the face between the rails mutt be 6 inches, and the rails as thin as polible: in all the rails ftick port-fires at four inches diftance. The Archimedian icrews, $G, K$, are nothing more than double piral wheels, with the cales placed on their wheels horizontally inftead of obliquels. The vertical fun, I, need not confitt of more than 12 rays, to form a fingle glory. The globe at top mult be made in proportion to the pyramid; which being prepared according to the preoeding directions, place your leaders fo that all the illuminating port-fires, ferews, globe, and fun, may take Fre together. The pyramid mult be fupported by the two fides, and by a fupport brought from a pole, which muft be placed two feet from the back of the pyramid, that the wheels may run free.
120. Ryfe piece and Sun.

A rofe-piece may be ufed for a mutation of a regulated piece, or fired by itfelf: it makes the beft appearance when made large ; if its exterior diameter be 6 feet, it will be a good lize. Fig. 8 thows the manner it appears in before it is fired. Let the exterinr fell be made of wood, and fupported by 4 wooden fpokes: all the other parts, on which the illuminations are fixed, muft be made of ftrong iron wire : on the exterior fell place as many half-pound cafes of b:illiant charge as you think proper, but the more the better;

## E C II N Y.

for the nearer the eafes are placed, he framger will be bifere. the rays of the fun : the illumations lhould be placed l'eces lirew within 3 inches of each other: they matt all be fired lire-w 11 . together, and burn fome time before the fun is lighted; Which may be done by carrying al lader from the mid. dle of one of the illuminations, to the mouth of one of the funcafes.
121. Tranfparent Stars zuith illuminatid Rays.

Fig. 9. reprefents an illuminated far. Leet the Jlate diameter from $A$ to $B$ bc 2 feet, and from C to ccccasis. 1) 7 fect. Firft make a ftrong circular back or body of the ftar, 2 feet diameter, to which you fix the il. luminated rays: in the centre of the front of the body lix a fpindle, on which put a double triungular wheel, 6 inches diameter, clothed with 2 ounce cales of brilliant charge : the cafes on this wheel muft burn but one at a time. Round the edge of the body nail :t hoop made of thin wood or tin: this hoop muft project in front 6 or 7 inches: in this hoop cut 3 or $\div$ holes to let out the fmoke from the wheel. The ftats and gatter may be cut out of frong paltcboard or tin, made in this manner: Cut a round piece of palleboard or tin, 2 feet diameter, on which driw a Atar, and cut it out ; then over the vacancy pafte Perlian filk; paint the letters yellow; 4 of the rays yellow, and 4 red; the crofs in the middle may be painted half red and halt yellow, or yellow and blue. This tranfparent far mut be faftened to the wonden hoop by a fcrew, to take off and on; the illuminated rays are made of thin rood, with tin fockets fixed on-their fides within 4 inches of each other ; in thefe fockets ftich illuminating portfircs; behind the point of each ray fix a half puond cafe of grey, black, or Chinefe fire.
N. B. The illuminated rays to be lighted at the fame time as the triangular wheel, or after it is burnt ont; which may be done by a tin barrel being fixed to the wheel, after the manner of thofe in the regulated pieces. Into this barrel carry a leader from the illuminated rays, through the back of the far ; which leader mutt be met by another, brought from the tail of the lalt cafe on the wheel.

## 122. Tranfparent Talle Star illuninated.

Fig. 1. reprelents a table far, whofe diameter, from E to $F$, is 12 feet; and from $E$ to $I,+$ feet. This scecxixir. proportion, obferved on each fide, will make the centre frame 4 feet fquare: in this fquare fir a tranfparent ftar, as in the figure. This ftar may be painted blue, and its rays m.tde as thofe of the flaming fars deferibed before. The wheal for this ftar may be compofed of different coloured fires, with a charge or two of flow fire; the wheels $a, a, a, a$, may be clothed with any number of cales, fo that the far. wheel confitt of the fume : the illuminating port-fires, which muit be placed very near each other on the frames, mult be fo managed as to burn as long as the wheels, and lighted at the fume time.
123. The regulated illuninated Spiral Piece, with a projetted Star-zubel ill:minated.
This piece is reprefented by fig. 2 . and is thus made. Have a block made $S$ inches ciameter; in this block fcrew 6 iron fuokes, which mutt ferve for pindles for the fpiral wheels : there whecls are made as ulual, e.tch I $\frac{1}{3}$ foot diameter, and 3 feet in heisht: the fpindles mut be long enough to make the wheels + or 5 inches from one another : at :lse end of each frindle mult bea
fcrew-nut, on which the wheels that hang downwards will rmn ; and on the fpindles which fland upwards muft be a fhoulder, for the blocks of the whecls to iun on.
The projected ftar-wheel mult turn on the fame fpindle on which the large block is fixed; this findle nula be long enough to allow the ftar-wheel to projent a little before the firal wheels: the exterior diameter of the f:ur-whecl muft be 3 feet 5 . On this wheel fix 3 ciccles of iron wire, and on them port-fires; on the block place a traufparent far, or a large 5 - pointed bitliant far. The cafes on this wheel may barn 4 at once, as it will contain ncar twice the number of one of the fpiral wheels: the cafes on the fpiral wheels mult be placed parallel to their fells, and burn two at a time.
125. Al Figurepicce ilhuminatell reith five-poinued Stars.

The conftruction of this piece is very eafy, as flewn by fig. 3. whofe diameter from B to C is 8 feet, and from D to F 2 feet: the vertical wheel in the centre muft be 1 foot dimeter, and confif of 6 four-ounce cafes of different coloured charge, which cafes mult burn double: on the frames fix 5 pointed brilliant or blue ftars, rammed 4 inches with compofition: let the jpace between cach ftar be 8 inches; at each point fix a gerbe, or cafe of Chinefe fire. When to Le fired, let the gerbe, flars, and wheel, be lighted at the fame time.
125. The Star-wbel illuminated.

This beautiful piece is fhown by fig. 4. Its exterior tell is made of wood, f feet $6, \mathrm{c}: 4$ feet diameter; within this fell, form with iron wire 3 circles, one lefs than the other, fo that the diameter of the leat may be about 10 inches: place the port-fires on thefe fells with their noonths inclining outwirds, and the port-fires on the points of the far with their mouths projecting in front : let the exterior fell be clothed with 4 ounce cafes of grey charge: thefe cafes mult burn 4 at a time, and be lighted at the fame time as the illuminations.

## 126. Pyrannid of Flower-pots.

Tig. 5 reprefents this curious piece, which muft be mate thus. Let the diftance from A to B be 6 feet; and from one rail to the other, 2 : on the bottom rail fix 5 paper mortars, each $3^{\prime}$, inches diameter ; thefe mortars load with ferpents, crackers, fars, \&cc.

In the centre of each mortar fix a cafe of fpur-fire : on the fecond rail fix 4 mortars, fo as to fand exaaty in the middle of the intervals of them on the bottom rail ; on the third rail place 3 mortars; on the fourth, 2 ; and on the top of the pofts, 1 : the bottcm rail mult be 6 feet long: all the mortars muft incline a little forwards, that they may eafily difcharge ; and the ipur-fires rammed eractly alike, that the mortars may all be fired at the fame time. Having prepared your pyramid according to the preceding directions, carry Pipes of communication from one fpur-fire to the other. 127. The illuminared Regulating P.ece.

Fig. 6. reprefents one half of this piece. A, A, $A, A$, are flat wooden fpokes, each 5 feet long: at the end of each place a vertical wheel, 10 inches diameter, clofed with 6 four-ounce cafes of brilliant fire: thefe cafes muft burn but 1 at a time: on two of the fpokes of each wheel place 2 port-fires, which mult be lighted with the firt cafe of the wheel ; on each fooke $A, A, \& \cdot c$ behind the wheels, place 6 cafes of the fame fize with thofe on the whecls: thefe cafes mult be fied acrofs the fpokes with their mouths all one way,
and be made to take fire fucceffively one after the other, fo that they may aflift the whole pieces to turn round.
The diameter of the large wheel muft be $2 \frac{1}{7}$ feet; and its fell made of wood, which muft be fixed to the large fpokes: on this wheel place 24 cafes of the fame fort with thofe on the finall wheels; thefe cafes mult burn 4 at a time: in this wheel make 3 circles with iron wire, and on them place illuminating fort-fires, as in the figure: the ftar-points on the large fpokes may be made of thin afh hoops; the diameter of thefe points clofe to the centre-wheel muft be it inches: on thefe points place port-fircs, at $3 \div$ inches diftance one from the other.

Fig. 7. reprefents the blocks of this piece. The diameters of thefe blocks, at $A$ and $B$, muft be 3 inches; and C and D, $4^{\prime}$, inches: the length of each of thefe blocks mult be 6 inches: at the fmall ends of thefe blocks fix an iron wheel 5 inches diameter, which wheels mult have teeth, to turn the wheel E: this wheel is fixed on a fmall fpindle ferewed into the large fpindle, which goes through the two blocks, and on which they run.

Supp. fing fig. 6 . to be on the block $A$, in fig. 7. and to turn to the right, and another piece of the fame conitruction on the block $B$, with its fires phiced fo as to turn it to the left; you will find them move very true and fatt, by the help of the 3 iron wheels, which ferve to regulate their motions, as well as to affit them in turning: let the iron circles in the front of the great whecls be of differcnt diameters, fo that when fired they may appear 6 circles. When this piece is fired, ali the whets and illuminations muft be lighted at one time.

## Sect. VI. Aquatic Fire-works.

Works that fport in the water are much efteemed by moft admirers of fire-works, particularly water-rockets; and as they feem of a very extraordinary nature to thofe who are unarquainted with this art, they merit a particular explanation.

May be made from 4 oz . to 2 lb . If litger, they are too heavy ; fo that it will be difficult to make them keep above water without a cork float, which mult be tied to the neck of the cate; but the rockets will not dive fo well with as without floats.

Cafes for thefe are made in the fame manner and proportion as fky-rockets, only a little thicker of paper. When you fill thofe which are drove folid, put in firf I ladleful of flow firc, then 2 of the proper charge, and un that 1 or 2 ladles of finking clarge, then the proper charge, then the linking. charge again, and fo on, till you have filled the cafe within 3 diameters; then drive on the compofition I ladleful of clay; through which make a fmall hole to the charge : then fill the cafe, within $\frac{1}{2}$ a diameter, with cornpowder, on which turn down 2 or 3 rounds of the cate in the infide; then pinch and tic the end wery tight; having filled your rockets (according to the above directions), dip their ends in melted rofin or fealing wax, or elfe fecure them well with greafe. When your fire thofe rockets, throw in 6 or 8 at a time; but, if you would have them all fink, or fwim, at the fame

Aquatic time, yon muf drive them with an cqual quantity of gerbe, which muft he lighted at the beginning of the Agraric fire-works compofition, and fire them alrogcther.
129. To make Pises of Commanication, which may be ufod under Water.
Pipes for this purpofe mult be a little thicker of paper than thofe for land. Having rolled a fufficiont number of pipes, and kepe them till dry, whth them over with drying oil, and fet them to dry; but when you oil them, leave about $1 \frac{8}{2}$ inch at each end dry, for joints : if they were oiled all over, when yon come to join them, the pafte would not fick where the piper is greafy: after the leaders are joined, and the patte dry, oil the joints. Thefe pipes will bie many hours under water, without recciving any damage.

> 130. Horizonal Whecls for the Water.

Firt get a lirge wooden bowl without a handic; then have an octagon wheel made of a Hat hoard I 8 inches diameter, fo that the length of each lide will be near 7 inches: in all the lides cut a groove for the cales to lie in. This wheel being made, nail it on the top of the bowl; then talie 4 -eight oz. cafcs, filled with a proper charge, each ahout 6 inches in length. Now, to clothe the wheel with thefe cates, get fome whitinl-brown paper, and cut it into flips 4 or 5 inches broad and 7 or 8 long: thete flips being pafted all over on one fide, take one of the cafes, and roll one of the flips of paper about $I \div$ inch on its end, fo that there will remain about $2 \frac{1}{5}$ inches of the paper hollow from the end of the cale: this cafe tic on one of the fides of the whee!, near the comers of which muft be holes bored, through which you put the packthread to tie the cafes: having ticd on the firt cafe at the neck and end, put a little meal-powder in the hollow paper ; then paite a flip, of paper on the end of another cafe, the head of which put into the hallow paper on the firlt, allowing a funficient diftance from the tail of one to the head of the other for the pafted paper to bend wirhout tearing: the fecond cafe tie on as you did the firft: and fo on with the reft, except the laft, which malt be clofed at the end, unlels it is to communicate to any thing on the top of the wheel, fuch as fire-pumps or brilliant fires, fixed in holes cut in the wheel, and fired by the laft or fecond cafe, as the fancy directs: 6,8 , or any number, may be placed on the top of the wheel, provided they be not too heavy for the bowl.

Before you tie on the cafes, cit the upper part of all their ends, except the hift, a little fhelving, that the fire from one may play over the other, without being obfructed by the cafe. Wheel-caies have no clay drove in their ends, nor pinched, but arc always left open, only the laft, or thofe which are not to lead fire, which muft be well fecured.

## 131. Water Mines.

For thefe mines you muft have a bowl with a wheel on it, made in the fame manner as the water-wheel ; conly in its middle there mult be a hole, of the fame diameter you defign to have the mine. Thefe mines are tin pots, with ftrong bottoms, and a little more than 2 diameters in length: your mine mult be fixed in the hole in the wheel, with its bottom refting on the bowl; then luaded with ferpents, crackers, ftars, fmall watcrrocke:s, \&c. in the fame manner as pots of aigrettes; but in their centre fix a cafe of Chinefe fire, or a fmail
iaft cafe on the wheel. Thefe wheels are to be clothed lire-we.ths as ulual.
132. Fircoglobes for the Water.
lowls for water-globes muft be very large, and the whecls on them of a decagon form : on each fide rit which nail a piece of wood 4 inches iong ; and on t?ic ontlide of each piece cut a groove, wide cnough to reccive about $\frac{1}{4}$ of the thicknefs of a $4-0 \%$ cafe: theic pieces of wood muft be nailed in the middle of each fice of the wheel, and fixed in an oblique direation, fo that the fire from the cafcs may incline upwards: the whocl being thms prepared, tic in each groove a $4-0 z$. care, filled with a grey charge; then carry a leader fiom the tail of one cale to the mouth of the other.

Globes for there wheels are made of 2 tin hoops, with thir edges ontwards, fixed one within the other, at right angles. The diameter of thefe hoops muft be fomewhat let's thatn that of the wheel. Having made a globe, drive in the centre of a whecl an iron fpindle, which muft fand perpendicular, and its length 4 or 6 inches more than the diameter of the globe.

This fpindle ferves for an axis, on which the globe is fixed, which, when done, muft fand 4 or 6 inches from the wheel: round one fide of cach hoop mult be foldered little bits of tin, $2_{\frac{7}{7}}$ inches dillance from cach other; which pieces mut be 2 inches in length caclo, and only faftened at one end, the other ends being lelt. loofe, to turn ronnd the fmall port-fires, and hold then on: thefe port-fires mut be made of fuch a length as will laft out the cafes on the wheel. You are to obferve, that there need not be any port-fires at the bottom of the globe within 4 inches of the fpindle; for, if there wese, they would have no effect, but only burn the wheel : all the port-fires muft be placed perpendicular from the centre of the globe, with their mouths outwards; and muft all be clothed with leaders, fo as all to take fire with the fecond cafe of the wheel; which cafes mult burn two at a time, one oppofite the other. When two cales of a wheel begin logether, two will end together: therefore the two uppolite end cafes muft have their ends pinched and fecured from fire. The method of firing fuch wheels is, by carrsing a leader from the mouth of one of the firft cales to that of the other ; which leader being burnt through the middle, will give fire to both at the fame tinae.

## 133. Odoriferous Water Bulloons.

Thefe balloons are made in the fame manner as airballoons, but very thin of paper, and in diamcter $1^{\frac{3}{4}}$ inch, with a vent of $\frac{2}{2}$ inch diameter. The thelis being made, and quite dry, fill them with ans of the following compolitions, which muft be rammed in tight : thefe ballons mutt befired at the vent, anal pat into a bowl of water. Odoriferous works are generally fired in rooms.

Compofition I. Sultencte 20 . flour of fulphur $10 z$. camplior $\frac{2}{2}$ oz. yellow amber $\frac{x}{2}$ oz. charcoal-duf $\frac{3}{4} \mathrm{nz}$. four of benjanin or alla cdorata $\frac{x}{3}$ oz. all powdered rers fine and woll mixed.
II. Salipetre 1207. meal-powder 307 . franhincenfe I oz. myrrh $\frac{1}{2}$ oz. camphor $\frac{z}{2} \mathrm{oz}$. charcoal 3 oz. all moiftened with the oil of fpike.
III. S:1tpetre 2 caz. filiphui $\frac{1}{2} n z$. antimony $\frac{t}{2} 07$. amber $\frac{2}{3}$ 07. cedar rafpings $\frac{1}{4} 0 \%$ all mixed with the oil ot refes and a few creps of ber samot.
IV. Salt, etre 4 oz. fulphur i oz. faw-dult of juni- actly the fame; then, when you begin the engagement, aquatic per $\frac{1}{2} \mathrm{nz}$. faw-duft of cyprefs 1 oz, camphor $\frac{1}{4}$ oz. myrih $z$ drachms, dried rofemary $\frac{1}{4}$ oz. cortex elaterii $\frac{1}{2}$ oz. all moitened a litule with the oil of 10 fes.
iv. B. Water rockets may be made with any of the above compolitions, with a little alteration, to make them weaker or flronger, according to the fize of the c.res.

## 13.r. TVater Balloons.

Having made fome thin paper thells, of what diameter you pleafe, thll fome with the compolition for water balloons, and forme after this manner: Having made the vent of the fiells pretty large, fill them almof full with water rockets, marrons, fquibs, \&ic. Then put in fome blowing powder, fufficient to burf the thells; and afterwards fix in the vent a water rocket, long enongh to reach thie bottom of the fhell, and its neek to projef a little out of the vent; this rocket mult be open at the end, to fire the powder in the flell, which will burft the flell, and difperfe the fmall rockets, sce in the water. When you have well fecured the large rocket in the vent of the thell, take a cork float with a hole in its middle, which fit over the head of the rocket, and fatten it to the fhell : this float mult be large enough to keep the balloon above water.

## 135. Water Squils

Are generally made of 1.0 oz . ferpent cafes feven or eight inches long, filled two-thists with charge, and the remainder bounced. The common method of firing them is this: Take a water-wheel, with a tin mortar in its centre, which load with fiquibs after the ufual method ; but the powder in the mortar muft be no more than will juft throw the fquibs out eafily into the water: you may place the cafes on the wheel either obliquely or horizontally; and on the top of the wheel, romnd the mortar, fix lix cafes of brilliant fire perpendicular to the whecl : there cafes mult be fired at the legianing of the latt care of the whecl, and the mortar at the conclufion of the fime.
${ }^{1}$ 36. At Sa-fight with finali Ships, and to prepare a FireJois for it.
Having procured four or five fmall hips, of two or threc feet in length, (or as many as you defign to fight), make a number of imall reports, which are to ferve for : uns. Of thefe range as many as you pleafe on each fide of the upper decks; then at the head and ftern of each thip fix a two ounce cafe, cight inches long, filled with a thow port fire receipt; but take care to place it in fuch a manner that the fire may fall in the water, and not bun the rigging: in thefe cafes bore holes at unequal diftances from one another, but make as many in each cale as half the number of rejorts, fo that one wafe may fire the guns on one fide, and the other thofe on the orporite. The method of firing the guns is, by carrying a leader from the holcs in the cafes to the zeports on the decks; yon munt make theic leaders rery fmall, and be careful in calculating the burning of the flow-fire in the segulating cafes, that more than two guns be not fired at a time. When you would have a broadfide given, let a leader be carried to a cracker, placed on the outfile of the fuip; whech cracker mult be tied loofe, or the reports will be too flow: in all the thins phit artificial guns at the port-holes.

Having filled and bored holes in two port.fires for regulating the guns in one fhip, make all the reft ex-
light one fhip firt, and fer it a failing, and fo on with Fire works the reft, fending them out fingly, which will make them fire regularly, at different times, with ut confution ; for the time between the firing of each gun will be equal to that of lighting the fow fires.
The fire-thip may be of any fize; and need not be very good, for it is always loft in the action. T'u prepare a thip for this purpofe, make a port-fire equal in fize with thofe in the other hips, and place it at the Atern ; in every port place a large port-fire, filled with a very frong compofition, and painted in imitation of a gun, and let them ail be fired at once by a leader from the flow fire, within two or three diameters of its bottom: all along both fides, on the top of the upper deck, lay ftar-compofition about half an inch thick and one broad, which mun be wetted with thin fize, then primed with meal-powder, and fecured from fire by patting paper over it ; in the place where you lay this compofition, drive fi me little tacks with flat heads, to hold it faft to the deck : this mult be fired jult after the flam guns, and when burning will flow a flame all round the thip: at the head take up the decks, and put in a tin mortar loaded with crackers, which mortar muf be fired by a pipe from the end of the flow fire; the firing of this montar will fink the fhip, and make a pretty conclufion. The regulating port fire of this hip mult be lighted at the fame time with the firlt fighting fhip.

Having prepared all the fhips for fighting, we flall next proceed with the management of them when on the water. At one end of the pond, jul under the furface of the water, fix two running blocks, at what diftance you choofe the fhips fhould fight ; and at the other end of the pond, oppofite to each of thele blocks, under the water, fix a double block; then on the land, by each of the double blocks, place cwo fmall windlaffes; round one of them turn one end of a fmall cord, and the other end put through one of the blocks; then carry it through the fingle one at the oppofite end of the pond, and bring it back through the double block again, and round the other windlats : to this cord, near the double block, tie as many fmall ftrings as half the number of the fhips, at what diflance you think proper; but thefe frings mult not be more than two feet each : make faft the loofe end of each to a hip, jut under her bow-fprit; but it tied to the keel, or too near the water, it will overfet the fhip. Half the fhips being thus prepared, near the other double block fix two more windilaffes, to which faften a cord, and to it tic the other half of the flips as before : when you fire the thips, pull in the cord with one of the windlafies, to get all the hips together; and when you have fet fire to the firl, turn that windlafs which draws them out, and fo on with the ref, till they are all out in the middle of the pond; then, by torning the other wind. lafs, you will draw then back again ; by which method you may make them change lides, and tack about backwards and forwards at pleafure. For the fire-fhip, fix the blocks and windlafies between the others; fo that when the fails out, the will be between the other thips: you mult not let this thip advance till the guns at her ports take fire.
137. To fire Sky-rockets under Water,

You muft have fands made as ufual, only the rails

Aquatic muft be placed flat infteal of edgewife, and have holes ire-works in them for the rocket-Aticks to go through ; for if they were hung upon hooks, the motion of the water would throw them off: the ftands being made, if the pond is deep enough, fink them at the fides fo deep, that, when the ruckets are in, their heads may jult appear above the furface of the water; to the mouth of each rocket fix a leader, which put throurly the hole with the ftick; then a littie :tbove the water mult be a board, fupported by the Aand, and placed along one fide of the rockets; then the ends of the leaders are turned $n$ p through holes made in this board, exactly oppolite the rocke's. By this means you may fire them lingly or all at once. Rockets may be fired by this method in the middle of a pend, by a Neptunc, a fwan, a waterwheel, or any thing elfe fou choofe.
${ }^{1} 3$ S. To reprefut Neptone in his Clariot.
To do this to perfection, you muft have a Neptune (made of wood, or balket work) as big as life, fixed on a flat large enough to bear his weight; on which mut be two horfes heads and necks, fo as to feem fwimming, as fhown by fig. it. For the wheels of the chariot, there mult be two vertical wheels of black fire, and on Neptune's head a horizontal wbeel of brilliant fire, with all its cafes, to play upwards. When this wheel is made, cover it with paper or pafteboard, cut and painted like Neptune's coronet; then let the trident be made without prongs, but inltead of them, fix three cafes of a weak grey charge, and on each horfe's head put an eight ounce cale of brilliant fire, and on the minuth of each fix a fhort cafe, of the fame diameter, filled with the whiteflame receipt, enough to laft out all the cafes on the wheels: thefe fhort cafes mult be open at bottom, that they may light the brilliant fires; for the horfes eyes put finall port-fires, and in each noftril put a fmall cafe filled half with grey charge, and the reft with port-fire compofition.

If Neptune is to give fire to any building on the water; at his firlt fettirg out, the wheels of the chariot, and that on his head, with the white flames on the horfes heads, and the port-fires in their eyes and nofrils, mult all be lighted at once; then from the bottom of the white flames carry is leader to the trident. As Neptune is to advance by the help of a block and cord, you mult manage it fo as not to let lim turn about, till the brilliant fires on the horfes and the trident begin ; for it is by the fire from the horfes (which plays almoft upright) that the building, or work, is lighted; which mult be thus prepared. From the nouth of the cafe which is to be firlt fired, hang fome loofe quick-match to receive the fire from the horfes. When Neptune is orly to be fhown by hinfelf, without fetting fire to any other works, let the white flames en the horfes be very fhort, and not lait longer than
one cafe of each whecl, and let two cafes of each wheel burn at a time.
${ }^{1} 32$. Sruans and Duiks in Wratir.
If rou would have the fwans or ducks difcharge rockets into the water, they mu?t be made hollow, and of paper, and filled with fmall water rockets, with fome blowing powder to throw them out: but if this is not done, they may be made of wood, which will haft many times. Having made and painted fome fwans, fix then on floats: then in the places where their eyes floould be, bore holes two inches deep, inclining downwar\}, and wide enough to receive a fmall port-bre ; the portfire cales for this purpofe muft be made of brafs, two inches long, and filled with a flow bright charge. Its the middle of one of there cafes make a little hole; then put the port-fire in the eye-hole of the fwan, ledving about half an inch to projef out; and in the other eje put another port-fire, with a hole made in it: then in the neck of the fwan, within two inclies of one of the eyes, bore a hole flantwife, to meet that in the portfire; in this hole put a leader, and carry it to a water rocket, that mult be fixed under the tail with its mouth upwards. On the top of the head place two $1-0 z$. cafes, four inches long each, drove with brilliant fite; one of thefe cafes mutt incline forwards, and the other backwards: thefc mult be lighted at the fame time at the water-rocket; to do which, bore a hole between them in the top of the fwan's head, down to the hole in the port-fire, to which carry a leader: if the fwan is filled with rockets, they mult be fired by a pipe from the end of the water-rocket under the tail. When you fet the fwan a fwimming, light the two eyes.
140. Water Fire-fountains.

To make a fire-fountain, you rnult firlt have a float made of wood, three feet dinmeter; then in the middle fix a round perpendicular polt, four feet high, and two inches diameter; rcund this poft fix three circular wheels made of thin wood, without any fookes. The largeft of thefe wheels mult be placed within two or three inches of the float, and mutt be nearly of the fame drameter. The fecond wheel mult be 2 feet 2 inches diameter, and fixed at two feet diftance from the firlt. The third wheel mult be 1 foot 4 inches diameter, ard fixed within fix inches of the top of the poit: the wheels being fixed, take is four or eight oz. cafes of brilliant fire, and place them round the firt wheel with their mouths outwards, and inclining downwards; on the fecond wheel place 13 cafes of the fame, and in the fame manner as thofe on the firt ; on the third, place 8 more of thefe cafes, in the fame manner as betore, and on the top of the polt fix a gerbe; then clothe all the cafes with leaders, fo that both they and the gerbe may take fire at the fame time. Before you fire this work, try it in the water to fee if the float is properly made, fo as to keep the fountain upright.

## P Y R

PYROTICS, in medicine, cauftics, or remedies either aftually or potentially hot; and which accordingly will burs the Aeth, and raife an efchar. See Causticity.

EYRRHICHA, in antiquity, a kind of exercife on

P Y R
horfeback, or a feignced combat, for the exercife of the cavalry.

It was thus called from its inventor Pyr:hehus, ot Pyrrhus of Cydonia, who firlt taught the Cretans to march in meadure and cacience to battle, and to ob-

## P Y R <br> [ 720 ]

ferve the pace of the Pyrmic foot.- Others derive the nane from l'yrrhus the fon of Achilles, who inflituted this exercile at the obfequies of his father. Arifotle fays, that it was Achilles himfelf who inventedit.

The Romans allo called it ludus Trojanus, " the Trofan grame ; and Aulus Gellius, decurfis.-It is doubtlefs this exercife that we fee reprefented on medals by two cavaliers in front rumning with lancets, and the word decurfo in the exergum.

PYRRHICH1US, in the Greek and Latin poetry, a foot confiting of two fyllables, both fhort;-as, Deus.-Among the ancients this foot is alfo called prriamlas; by others hegemont.

PYRRHO, a Greek philoopher, born at Elis in Pelopoanefus, flourifhed about 300 B. C. He was the difciple of A raxatrchus, whom he accompanied as far as India, where he converfed with the Brachmans and Gymnofoplifts. He had made painting his profeffion before he devoted himfelf to the ftudy of philofophy. He eftablifhed a feet whofe fundamental principle was, That there is nothing true or falfe, 1 ight or wrong, honef or difhoneft, juft or unjuit ; or that there is no ftandard of any thing beyond law or cultom, and that uncertainty and doubt belong to every thing. From this continual feeking after truth and never finding it, the fect ohtained the name of Sceplics or Pyrrbonians from the founder, who is faid to have atted upon his own principles, and to have carried his feepticifm to fuch a ridiculous extreme, that his friends were obliged to accompany him wherever he went, that he might not be run over by carriages, or fall down precipices. If this was true, it was not without reafon that he was ranked among thole whofe intellects were difturbed by intenfe Itudy. But it is treated by a modern writer as a mere calumny invented by the dogmatifs; and we are ftrongly incl ned to be of his opinion, (fee Eceptics.) Pyrrho died absut the goth year of his age, when his memory was honoured with a fatue at A. thens, and a monument erected to him in his own country.

PYRRHUS, the name of two kings of Epirus. See that article.

PYRUS, the pear-tree: A genus of the pentagynia order, belonging to the icolandria clafs of plants; and in the natural method ranking under the $3^{6} \mathrm{~h}$ order, Pomacia. The calyx is quinquefid; there are five petals; the fruit is an apple, inierior, quinquelocular, and poly/permons. To this genus Limeus has joised the :ypple and quince; but, on account of the remarkable difference between the fruits, the laft is treated under the article Cydonia. The other tpecies are,

1. The communis, or common pear-tree, rifes with an upright large truak, branching 30 or 40 feet high, in fome widely around, in others more erestly, and forming a conical head; oval, lanceolated, ferrated leaves, and corymbous clutters of white flowers from the ficles of the branches, fucceeded by large fruit extended at the bafe. Under this fpecies ate comprelended almoft endlefs valie:ics, all learing the above defcription. They bear their flowers and fruit a on fipurs, ariling from the fides of the branches from two or tirree years old and upwards; the fame branches and fpurs continuing fruifful for a great number of
years. The different varieties furnifh firit for ufe from the beginning of July till the months of May and June, next year ; which, according to their times of ripening may be divided into three claffes, fummer-pears, au-tumn-pears, and winter-pears. The fummer pears ripen in different forts from the beginning of July montil the middle or end of September, and are generally fit to cat from the tree, or at leaft do not keep a week or two before they rot. The autumn pars come to their perfection in Oftober, November, and 1)ecember; fome ripening nearly on the tree in October and the begiming of November, others requiring to lie fome time in the fruitery, while fome will keep two months: but all the winter-pears, though they attain their full growth on the tree by the end of Oct ber and in November, yet they do not acquire perfection for eating till from the end of Nevember to April and May. Thofe of each clafs have different properties ; fome being melting, others breaking, fome mealy, and fome hard and auftere, fit only for kitchen ufes. As many of the finefl forts were firft obtained from France, they are fill continued in molt catalogues by French names.
2. The malus, or common apple-tree, grows 20 or 30 feet high, having oval ferrated leavas, and feffile umbels of whitift red flowers, fucceeded by large, roundifh, and oblong fruit, concave at the bafe. The apple is compofed of four dillinet parts, viz. the pill, the parenchyma, the branchery, and the core. The pill or k in is only a diiatation of the outermof fikin or rind of the bark of the branch on which it grew. The parenchyma or pulp, as tender and delicious as it is found, is only a dilatation, or, as Dr Grew calls it, a fwedthb or fuperbience of the inncr part of the bark of the branch. This appears not only from the vifible continuation of the bark from the one through the pedicle or falk to the other, but alfo fron the fructure common to both. The branchery or veffels are only ramifications of the woody part of the branch, fent throughout all the parts of the parenchyma, the greater brancles being made to communicate with each other by inofculations of the lefs. The apple core is originally from the pith of the branch; the fap of which finding room enough in the parenchymat through which to diffute ittelf, quits the pith, which by this means hardens into core. The varieties of this fpecies are amazingly great with refpect to the differences of the fruit. The batanifts contend, that the wilding, or crab-apple of the woods and hedges, is the original kins, and from the feels of which the cultivated :apple was firft ebtained. The varieties of this laft no doubt are multiplied to fome hundreds in difierent places, having been all firf accidentally obtained from the fecd o: kernels of the fruit, and the approved forts continued and increafed by grafting upon crahs or any kind of appleflocks: but alhough the number of varieties is very confiderable, there are not above 40 or 50 forts retained in the nurferymens catalogue. Thefe varieties arrive at full growih in fucceffive order from July to the end of October, improve in perfection after being gathered; and feveral of the winter linds, in particilar, keep good for many months, even till the arrival of apples next fummer.

Among thefe various kinds of apples fome are ufed for the defert, fome for the kitchen, and fome for cy-

Pyrus,
der-making. Thofe ufte tor the defert are the following, phaccu as they fuccelinely sipen alter one another: The white juncaung, the mangret apple, the funmer pearmain, the fummer queemnt, the cnibroideres. apple, the golden rennet, the fummer "hite calville, the fummer red catville, the filver fipen, the aromatic pippen, ha reinette grife, la bunte lionti, the poyd rulfeting, Whecler's rullet, Shaup's ratliet, the spure apple, the golden pippen, the nomparcil, the $l^{\prime} e^{3} i$ or pomane a'ali. Thofe for the kitchen afe, in the oider of their ripening, are thele : The codling, the fummer marygold, the fummer red peamain, the Huiland pippen, the lientifh pippen, the counpendu, Loan's pearnain, the Irench rennet, the French pippen, the 1oyal ruffet, the montitrous rennet, the winter $f$ caman, the pomme riodette, Spencer's pippen, the fivane pippen, and the oaken pippen. Thofe mote efteemed for cydet are, the Devonilite royal wild. ing, the redifteak apple, the whitfour, the Heretordflure under-liat, and the John apple, or deax arnes, everlatting bangcr, and gennet muylc.

The juice of apples is a menfrum for iron. A folution of iron in the juice of the apples called golden renn:/ts, evap rated to a thick confiftence, proves an elegant chalybeate, which keeps well.

The belt method of preferving apples for winter ufe, is to let them hang upon the trees until there is danger of frolt, to gather them in dry weather, and then to lay them in lurge heaps to fweat for a month or fix weeks. They ought then to be carefully looked over, all which have the leaft appearance of ciecay taken out, the found fruit wiped dry, and packed up in large oil jars, which have been thoronghly fealded and dry, and then itopped clofe to exclude the air. If this plan is duly obferved, the fruit will keep a long time found, and their fieth remain plump; whereas, when expofed to the air, their tkins will flitivel, and their pulp foften.
3. The coronaria, or fweet-ficented crab of Virginia, grows 12 or 15 feet high, having angular, ferrated leaves, pedunculated umbels of whitifh-red, fiveet-fcented flowers, fucceeded by fmall round crabs, remarkably four and auttere. There is one variety, called the evergrcen Virginian crab tree.

Culture. All the varieties of the pear-tree are hardy, and will fucceed in any common foil of a garden or orchard. They are propagated by grafting and budding upon any kind of pear-tiucks; alio occationally upon quince-dtecks, and fometimes upon white-thorn itocks; but pear-Itocks are greatly preferable to all others fur general we.-All kinds of :uples are propagated in the lame manner; uting applc-ttocks inftead of pear-ftocks. They will fucceed in any common foil of a garden or orchard, and in any free fithation except in a low and very moift foil, in which they are apt to canker, and very foon go ofic. In a friable loam they ate generally very fuccetsful.
PYTHAGORAS, a celebrated philotopher of antiquity, refpecting the time and place of whore birth the learned are much dividect. Eratofthenes afferts, that in the 48 th Olympiad *, when he was very young, he was a vifor at the Olympic games. Hence Dr Bentley + deternines the date of his birth to be the 4 th year of the $43^{d}$ Olympiad; whilft Llogd $\ddagger$, who denies that the Olympic vitor was the fame perfon with the Philofophcr, places it about the 3 d year of the 4 Sth $O$. lympiad. Mr Dodwell o difers from both, and withes Yoz. XV.
 writere, Le Cllere has gwea : bumanary in he Jiblooheque Cboific, tum. x. p. xi. \&x. all fimm ateriew o: the whole, it would appers that has vas not bom earlier thata the fhe joar of the 43 d (I)mpiat, wer later than the 4 th year of the 52 d ; but in what particular year of that period his birth texk place, cannot with any degree ol certaiaty be atcertaiinct. It is generally believed that he was horn in the ifland of Samos, and that he floutithed about 500 years before Clirith, in the tume of Tarduin the latt king of Rome *. His Csther Mnefurchus, who is thought by fome to hare been a lapidary, and by others a merchant of Tyre, appeats to have been a man of fome diftinction, and to have beftuwed u:on his fon the beft education.

Jamblicus $\dagger$ relates a number of wonderfal ftories re- + Vit. $\Gamma_{y}-$ fyeding Pythagoras's defcent from Jupiter, his birth, thay, n. 6 : and early l.fe; and reprefents him even in his youth as a prodigy of wifdomand marly feriouneef. Wui moft of there idle tales confute thenifelves, whord nothing of importance to be depended upon, and only frove the credulity, careleffnefs, and prejudice of their author. Of his childhod and early education we know nothing, except that he was firt intructed in his own country by Creophilus, and afterwards in Scyrus by Pherecydes (fec Pherectdes). Aecording to the cuftom of the times he was made acquainted with poetry and mufic; eloquence and attronomy became his private fudies, and in gymnaltic exercifes he ofien bore the palm for trength and dextesity. He firit difinguifhed himfelf in grecee at the Olympic games, where, befide gaining the prize, he is faid to have excited the higheft admiration by the elegance and dignity of his perfon, and the brilliancy of his underitanding.

Soon after his appeanance at thefe games Pythagoras commenced his travels in queft of knowledge. He firt vifited Egypt, where, through the interell of Polycrate tyrant of Sumos, he obtained the patronage of Amalis king of Egrpt, by whofe influence, combined with his owa alfiduty, fatience, and perfeverance, he at length gained the confidence of the prietts; from whom he learned their facred myfteries, theology, and the whole fyitem of fymbolical learning. In Egypt, too, he became acquainted with geometry and l!e true folar fyitem; and, before he left that country, made himfelf malter of all the leaming for which it was fo famed among the nations of antiquity.

He afterwards vifited Perlia and Chaldea, where from the Magi he learnt divimation, the interpreting of dreams, and aftronony. He is likewife laid to lave travelled into India, to have converfed with the Gymnofophits, and to have acquired from them a knowledge of the philofophy and literature of the eall ; and fuch was his ardour in the purfuit of fcience, that in queft of it, we are told by Cicero *, he croffed many feas, and travelled on fiot through many barbarous nations.

After Pythagoras had fpent many years in gathering information on every fubject, efpecially refpetting the nature of the gods, the rites of religion, and the immortality of the human foul, he returned to his native inland, and attempted to make his knowle dre ufeful by inltituting a fohool for the intruction of his countrymen. Fating of fuccefs in this laudable undertaking, he
repaired

Iythago 5as.
repaired to Delos, where lie pretended to receive ders; cxoterici, or profelytes of the gate; and intrinmoral dogmas from the prieftefs of Apollo. He alfo vifited Crete, where he was initiated into the moft facred mytheries of Grecce. He weint likewile to Sparta and Elis, and again affifted at the Olympic games; where in the public affembly he was faluted with the title of fopliff or quile man, which he declined for one more humble. See Philology, \(n^{\circ}\) I. and Philoso. PHY \(\mathrm{n}^{\circ}{ }_{1}\).

He returned to Sumos enriched with mythol gical learning and myfterions rites, and again inftituted a fchool. His myfterious fymbols and oracular precepts made this attempt more fuccefsful than the former had been; but meeting with fome oppofition, or being detected in fome pious frauds, he fuddenly left Samos, retired to Magna Grecia, and fettled at Crotona.

Here he founded the Italic fect (fee Philosophy \(n^{\circ} 20\).) ; and his mental and perfonal accomplifhments, the fame of his diftant travels, and his Olympic crown, foon procured him numerous pupils. His buld and manly eloquence and graceful delivery attracted the moft diffolute, and produced a remarkable change in the norals of the people of Crotona. His influence was increaled by the regularity of his own example, and its conformity to his precepts. He punctually attended the temples of the gods, and paid his devotions at an early hour; he lived upon the pureft and molt innocent food, clothed himfelf like the priefts of Egypt, and by his continual purifications and regelar offer ings appeared to be fuperior in fanctity to the reft of mankind. He endeavoured to affuage the paffions of his fcholars with verfes and numbers, and made a practice of compofing his own mind every morning, by playing on his harp, and finging along with it the prans of Thales. To avoid the temptations of eafe and the feductions of idlenefs, bodily exercifes alfo made a confiderable part of his difcipline.

At Crotona he had a public fchool for the general benefit of the people, in which he tanght them their duty, praifing virtue and condemning vice; and particularly inftructing them in the duties of focial life. Eefides this, he had a college in his own houfe, which he denominated rorvoßror, in which there were two claffes of ftudents, viz. sदersparor, who were alfo called aufubdisntes and ecuetpusor. The former of thefe were probationers, and were kept under a long examen. A filence of five years was impofed upon them ; which \(A\). puleius thinks was intended to teach them modefty and attention; but Clemens Alexandrinus thinks it was for the purpofe of ablirating their minds from fenfible objects, and inuring them to the pure contemplation of the Deity. The latter clafs of fcholars were called genuini, perfecti, mathematici, and, by way of eminence, Pythagorears. They alone were admitted to the knowledge of the arcana and depths of Pythagoric difcipline, and were taught the ufe of ciphers and hieroglyphic writings.

Clemens obferves, that thefe orders correfponded sery exatly to thofe among the Hebrews: for in the ichools of the prophets there were two claffes, viz. the fons of the prophets, who were the fcholars, and the doctors or matters, who were allo called perfeai ; and among the Levites, the novices or tyros, who had their quinquennial exercifes, by way of preparation. Ladly, even among the profelytes there were two or-
feci or perfini, profelytes of the covenant. He acids, it is highly probable, that Pythagoras himfelf had been a profelyte of the gate, if not of the covenant. Gale endeavours to prove that l'ythagoras borrowed his philofophy from that of the Jews; to this end producing the authorities of many of the fathers and ancient authors, and even pointing out the tracks and footiteps of Mofes in feveral parts of Pythagoras's doctine. But we believe the learned author was mifled by the Chrittian Platonifts.

The authority of Pythagoras among his pupils was fo grat, that it was even deemed a crime to difpute his word; and their arguments were confidered as infallibly convincing, if they could enforce them by adding, that "the malter faid fo:" an expreflion which afterwards became proverbial in jurare in verba m.pgillri. This influence over his fchool was foon extended to the world, and even his pupils themfelves divided the applaufe and approbation of the people with their mafter; and the rulers and legiflator, of all the principal towns of Grecce, Sicily, and Italy, boatted of being the difciples of Pythagoras. To give more weight to his exhortations, as fome writers mention, Pythagoras retired into a fubterraneous cave, where his mother fent him intelligence of every thing which happened during his abfence. After a certain number of morths he again re-appeared on the earth witlı a grim and ghafly countenance, and declared in the atembly of the people that he was returned from hell. From fimilar exaggerations it has been afferted that he appeared at the Olympic games with a golden thigh, and that he could write in letters of blood whatever he pleafed on a look-ing-glafs; and that by fetting it oppofite to the moon, when full, all the characters which were on the glafs became legible on the moon's difc. They allo relate, that by fome magical words he tamed a bear, ftopped the flight of an eagle, and appeared on the fame day and at the fame inftant in the cities of Crotona and Metapontum, \&c.

At length his fingular doetrines, and perhaps his frenunufly afferting the rights of the people againft their tyrannical governors, excited a fpirit of jealonly, and raifed a powerful party againt him ; which foon became fo outrageous as to oblige him to fly for his life. His friends fled to Rhegium ; and he himfelf, after being refufed protection by the Locrians, fled to Metapontum, where he was obliced to take refuge in the temple of the mufes, and where it is faid he died of hunger about 497 jears before Chrit. Refpecting the time, place, and manner of his death, however, there are various opinions, and many think it uncertain when, where, or in what manner, he ended his days. After his death his followers paid the fame refpect to him as was paid to the immortal geds; they erected fatues in honour of him, converted his houfe at Cro. tona into a temple of Ceres, appealed to him as a deity, and fwore by his name.

Pythagoras married Thean of Crotona, or, according to others, of Crete, by whom he had two fons, Telauges and Mnefarchus, who, after his death, took care of his fchool. He is faid alfo to have had a daughter called Damo.

Whether he left any writings behind him is difputed. It feems probable, however, that be left none, and that fuch

\section*{PYT [ 723 ] PYT}

Pythago. fuch as went under his name were written by fome of his followers. The golden errfis which Hierocles illu. Atrated with a commentary, hase been aforibed to Epicharmus or Empedocles, and contain a briel fummary of his popular deftrines. From this circumftance, and from the mytterious fecrecy with which he tanght, our information concerning his dotrine and philolophy is very wacertain, and cannot always be depended on.

The purpore of philofophy, according to the fyftem of Pythaguras, is to free the mind from incumbrances, and to ratie it to the contemplation of immutable truth and the knowledge of divine and fpiritual objezt. 'l'o bring the mind to this Pate of perfection is a work of fome difficulty, and requires a varicty of intermediate Iteps. Mathematical fience was with him the firtt Itep to wifdom, becaufe it inures the mind to contemplation, and takes a middle courfe between corporeal and incorporeal beings. The whole fience he divided into two parts, numbers and magnitude; and each of thele he fubdivided into two others, the former into aritlonstic and muft, and the latter into sagnitude at refl and in motion; the former of which comprehends geon:try, and the latter aftronomy. Asithmetic he confidered as the nobleft fcience, and an acquaintance with numbers ais the higheft good. He confidered numbers as the principles of every thing ; and divided them into fcientific and intelligible. Scientific number is the production of the powers involved in unity, and its return to the fame; number is not infinite, but is the fource of that infinite divifability into equal parts which is che propesty of all bodies. Intelligible numbers are thefe which exifted in the divine mind before all things. They are the model or archetype of the world, and the caufe of the effence of beings. Of the Monad, Duad, Triad, Tetrad, and Decad, various explanations have been given by various authors ; but nothing certain or important is known of them. In all probability, numbers were ufed by Psthagoras as fymbolical reprelentations of the firlt principles and forms of nature, and efpecially of thofe eternal and immutable effences which Plato denominated ideas; and in this cafe the monad was the fimple root from which he conceired numbers to proceed, and as fuch, analogrous to the timple effence of deity; from whence, according to his fyitem, the various properties of nature proceed.
Mufic followed numbers, and was ufeful in raifing the mind above the dominion of the paffions. Pythagoras confidered it as a fience to be reduced to mathematical principles and proportions, and is faid to have difcovered the mufical chords from the circumftance of feveral men fucceflive'y friking with hammers a piece of heated uton upon an anvil. This ltory Dr Burney * difcredits; but allows, from the uniform teftimony of writers ancient and modern, that he invented the har. monical canon or monochord, (fee Monochord.) The mufic of the fpheres, of which every one has heard, was a moft fanciful doctrine of Pythagoras. It was produced, he imagined, by the planets itriking on the cther through which in their motion they paffed; and he confidered their mufical proportions as exact, and their harmony perfect.

Pythagnras, as we have already feen, learned geometry in Egypt; but by inveltigating many new theorems, and by digelting its principles, he reduced it to a more regular fcience. A geometrical point, which he defines
to be a monad, or nity with pofition, he fays cores. P'ythere fponds to unity in arillmetic, al line to two, a fuperti. cies to three, and a folid to four. He difocvered feveral of the propohtions of Euclid; and on difcuvaing the 47 th of book ift, he is faid to have off red a liecitomb to the grods; but as he was averfe to animal facrifices, this aflestion is furely falfe. His great progrefs in altronomical fcience has been mentioned elfewhere. Sce Astronomy, \(\mathrm{n}^{\circ} 11,22\); and Philosorhy, \(\mathrm{n}^{\circ} 15,10\).

Widom, according to l'ythagoras, is convesfant with thote objects which arc naturally immutable, cter. nal, and incorruptible; and its end is to affimilate the hu. man mind to the divine, and to qualify us to jo in the alfembly of the gods. Active and moral philurophy prefcribes rules and precepts for the conduct of life, and leads us to the practice of public and private virtue.On thefe heads many of his precepts were excellent, and fome of them were whimfical and ufelefs. Theoretical philofophy treats of nature and its origin, and is, according to Pythagoras, the highen objeat of Ptuds. It included all the profound my feries which he taught, of which but little is now known. God he confiders as the univerfal mind, diffufed through all things, and the felf-moving principle of all things (autouatioucs ォãy Tarcây), and of whom every human foul is a portion*. It is very probable, that he conceived of the Deity as a fubtle fire, eternal, active, and intelligent; which is not inconfiftert with the idea of incorporeality, as the ancients underflood that term. This Deity was primarily combined with the chaotic mafs of paffive matter, but he had the power of feparating himfelf, and fince the feparation he has remained diftinct. The learned Cudworth contends, that Prthagoras maintained a trinity of hypoftafes in the divine nature, fimilar to the Platonic triad (fee Platonism). We cannot fay that his arguments appear to have much force; but we think the conclution which he wifhes to eftablifh extremely probable, as Plato certainly drew his dostrine from fome of the countries which Pythagoras had vifited before him.

Subordinate to the Deity there were in the Pythagorean creed three orders of intelligences, gods, demons, and heroes, of different degrees of excellence and dignity. Thefe, together with the human foul, were conf1dered as emanations from the Deity, the particles of fubtle ether affuming a grofler clothing the farther they receded from the fountain. Hierocles defines a hern to be a rational mind united with a luminous body. God himfelf was reprefented under the notion of monad, and the fi:bordinate intciligences as numbers derived from and included in unity. Man is confidered as consiting of an elementary nature and a divine or rational foul. His foul, a felf-moving principle, is compored of two parts; the rational, feated in the brain ; and the irrational, including the paftions, in the heart. In both thefe refpects he participates with the brutes, whom the temperament of their body, \&c. allows not to act rationally. The fenfitive foul perifhes; the other affumes an ethereal vehicle, and paffes to the regions of the dead, till fent back to the earth to inhabit fome other body, brutal or human. See Metempsychosis. It was unqueftionably this netion which led Pythagoras and his followers to deny themfelves the ufe of fih, and to be fo peculiarly merciful to animals of every defcription. Some authors, however, fay, that flefh and beans, the ufe of which he alfo forbad, were prohibited,
- Cicero de Senect.

\section*{\begin{tabular}{l|lll} 
PY T & P & 724
\end{tabular}}
l'ythago- becaufe he fuppofed them to have been produecd from rs. the fame putrified matter, from which, at the creation of the world, man was formed.

Of the fymbols of Pythagoras little is known. They have been religioufly concealed; and though they have awakened much curiolity, and occalioned many ingenious conjectures, they ftill appear to us dark and triHing. As a fpecimen we give the following: "Adore the found of the whifpering wind. Stir not the fire with a fword. 'Turn afide from an edged tool. Pals not over a balance. Setting out on a journey, turn not back, for the furies will return with you. Breed nothing that hath crooked talons. Receive not a fwal. low into your houfe. Look not in a mirror by the light of a candle. At a facrifice pair not your nails. Eat not the heart or brain. Titte not that which hath fallen from the table. Break not bread. Sleep not at noon. When it thunders touch the earth. Pluck not a crown. Roaft not that which has been boiled. Sail not on the ground. Plant not a palm. Breed a cock, but do not facrifice it, for it is facred to the fun and moon. Plant maliows in thy garden, but eat them not. Abftain from beans."

The following precepts are more important: "Dif. courfe not of Pythagorean doetrines without light. Above all things govern your tongue. Engrave not the image of Godin a ring. Quit not your flation without the command of your general. Remember that the paths of virtue and of vice refemble the letter fisat. III. Y. To this fymbol Perfius refers \(\dagger\), when he fays,

\section*{Et tibi que Samios diduxit litera ramos, Surgentem dextro monflravit limite collem.}

There has the Samian I's inftructive make Pointed the road thy doubtful foot thould take ; There warn'd thy raw and yet unpractis'd youth, To tread the rifing right-hand path of truth.
The fcantinefs and uncertainty of our information refpecting Pythagoras, renders a regular and complete

ts.
account of his life and doctrines imponible. A mo. dern author \(\ddagger\) of profound crudition pronounces him to have been unqueftionally the wifet man that ever lived, if his matters the Egyptian priefts mult not be excepted. This is faying a great deal too much ; but that he was one of the moft diftinguifhed philofophers of antiquity, or, as Cicero expreffes it, vir praftanti
fapientia, appears very evident; and his mosal charac. Hythago ter has never been impeached. The nyfteious air which lue threw over his doctrines, and the apparent inanity of fome of his fymbols, have indeed fubjected him to the charge of impofture, and perhaps the charge is not wholly groundlel's: but when we conlider the age in which he lived, and the nature of the people with whom he had to deal, who would in all probability have refifted more open innovations, even this will not appear fo blameable as at firt fight we are apt to think it ; and it is worthy of notice, that the worft ftories of this kind have come down to us in a very queftionable fhape, and with much probability appear to be falfe.

PYTHACOREANS, a fect of ancient philofophers, fo called from being the followers of Pythago ras. See the preceding article.

PYTHIA, the prieltefs of Apollo at Delphi, by whom he delivered oracles. She was fo called from lythins, a name of that god, which is faid to have been given him on account of his victory over the ferpent Python.

The Pythia was at firlt required to be a young ginla but in later times fhe was a wuman of 50 years of age. The firt and mot famous Pythia was Phenmonöe. Oracles were at firt delivered by her in hexameter verfe. All the Pythias were to be pure virgins, and all of them delivered their oracles with great enthufiafm and violent agitations. See Oracle and Delphi.

PYTHIAN games, in Grecian antiquity, fports inftituted near Delphos in honour of Apollo, on account of his flaying the ferpent Python. See Apol-lo.-Thefe games, at their firf infitution, were celebrated only once in nine years; but afterwards every fifth year, from the number of the Parnaffian nymphs who came to congratulate A pollo, and to make him prefents on bis victory. The victor was crowned with garlands.

PYTHON, in fabulous hiftory, a monftrous ferpent, produced by the earth after Deucalion's deloge. Junn being exafperated at Latona, who was beloved by Jupiter, commanded this ferpent to deftroy her; but flying from the purfuit of the montter, fhe efcaped to Delos, where fhe was delivered of Diama and Apollo; the latter of whom at length deftroyed Python with his arrows, in memory of which victory the Pythian games were inAtituted. See Afollo.

\section*{Q.}

Q, or \(q\), the 16 th letter and 12 th confonant of under, one, are put into a canular form, for the paffage our alphabet; but is not to be found either in the Greek, old Latin, or Saxon alphabets ; and indeed fome would entirely exclude it, pretending that k ought to be ufed wherever this occurs. However, as it is formed in the voice in a different manner, it is unelo b edly a diftinct letter: for, in expreffing this found, the cheeks are contracted, and the lips, particularly the

\section*{of the breath.}

The \(q\) is never founded alone, but in conjunction. with n , as in quality, quefion, quite, quote, scc. and ne. ver ends any Englith word.

As a numeral, \(Q\) ftands for 500 ; and with a dafh over it, thus \(\overline{0}\), for 500,000 .

Ufed as an abbreviature, fignifies quantity, or quan-
fum. Thus, among phyfici.ns, \(q .7 \%\) is quanum plucot, i. e. "as much as you pleafe" of a thing ; and \(q . f\). is quantum fuffici, i. c. "as much as is nece1dary." (). E. D. among mathematicims, is quod erat demonfrandum, i. e. "which was to be denonltrated;" and O.E. F. is quod wat fachendum, i. e. "which was to be done." Q. D. among grammanians, is quifo dictum, i. c. "as it it were daid;" or, "as who thould fay." In the notes of the ancients, \(Q\) ftands for \(Q^{\circ}\) in \(n-\) tus, or \(\curvearrowleft\) nimius; Q. B. V. for guod lene vertin; Q. S. S. S. for qua fupria joripta funt; Q. M. for \(\mathcal{V}^{2}\) intus Mutius, or quomodo: (uint. for (.)"minius; and Quef. for quaflur.

QUAB, in iclithyology, the name of a Ruftan fith, which is faid to be at firlt a cadpole, then .1 frog, and at latt a fifh. Di: Mounfey, who made miny inquiries concerning thefe pretended changes, contiders them all as fabuluus. He had opportunty of feeing the fifh itfelf, and found that they fawned like other filles, and grew in lize, without any appearances to juftify the report. He adds, that they delight in very clear water, in rivers with fandy or ftony bottoms, and are never found in ftanding lakes, or in rivers paffing through marfly or molly grounds, where frogs choofe moft to be.

QUABES, are a free people of Africa, inlabiting the fouthern banks of the river Seftos, and between that and Sierra Leona. They are under the protection of the emperor of Manow.

QUACHA, or Quagga. See Equus, \({ }^{\circ} 5\).
QUACHILTO, in omithology, is the name of a very beautiful Bralilian bird, called allo yacazinli, and porphyrio Americanus. It is of a fine blackifh purple coluur, variegated with white; its beak is white while young, but becomes red as it grows older, and has a naked fpace at its bafis, refembling in fome fort the coot; its legs are of a yellowifh green; it lives about the waters, and feeds on filh, yet is a very well talted bird. It imitates the crowing of a common cock, and makes its mulic early in the morning.

QUACK, among phyficians, the fame with empiric. See the article Empiric.

QUADI, (Tacitus) ; a people of Germany, fituated to the fonth-eat o she mountains of Bohemia, on the banks of the Danube, and extending as far as the river Marus, or March, running by Moravia, which country they occupied.

QUADRAGESIMA, a denomination given to lent, from its contilting of 40 days. See Lenr.

CUADRANGLE, in geometry, the fame with a quadrilateral figure, or one conilling of four fides and four angles.

QUADRANS, the quarter or fourth part of any thing, pasticularly the as, or pound.

Quadrans, in Enclifh money, the fourth part of -a penny. Before the reign of Edward I. the fmallelt coin was a flering, or penny, marbed with a crofs; by the guidance of which a penny might be cut into halves for a halfpenny, or into quatters or four parts for farthings ; till, to avoid the fraud of unequal cuttings, that king coined halfpence and farthings in difinct round picces.

QUADRANT, in geometry, the arch of a circle, containing \(90^{\circ}\), or the fouth part of the entire periphery.

Sometimes alfo the fipace or area, incluced between Qumbare, this arcla and two raciii drawn from the centre to each extremity thercol, is called a guadrant, or, more properly, a quadranta! fpace, as being a quarter of an er:tire circle.
()uadrant, alfo denotes a mathematical inftrument of great ufe in aftronomy and navigation, for taking the altitudes of the fun and thars, ats afo for taking arsgles in furveying, sc.

This intrument is varioully contrived, and furnifhed with different apparatus, according to the various ufes it is intended tor ; but they all have this in common, that they confit of a quarter of a circle, whofe limb is divided inio \(90^{\circ}\). Some have a plammet fufpended fiom the centre, and are furnifhed with fights to loak through.

The principal and moft ufeful quadrants are the common firveying quadrant, altronomical quadrant, Adams's quadrant, Cole's quadrant, Gunter's qua drant, Hadley's quadrant, horodiaitical quadrant, Sutton's or Culiins's quadiant, and the finical quadrant, \&c. Of each of which in order.
I. The common furveying quadrant, is made of brafs, wood, or any other folid fubitance; the limb of which is divided into \(90^{\circ}\), and each of thefe farther divided into as many equal parts as the fpace will allow, either diagonally or otherwife. On one of the femidiameters are fitted two moveable fights; and to the centre is fometimes alfo fixed a label, or moveable index, bearing two other fights ; but in lieu of thefe latt fights the:is fonctimes fitted a tclefope: alfo from the centre there is hung a thread with a plummet; and on the under fide or face of the inltrument is fitted a ball and focket, by means of which it may be put into any pofition. The gencral ufe of it is for taking angles in a vertical plane, comprehended under right limes going from the centre of the inftrument, one of which is horizontal, and the other is directed to fome vilible point. But befides the parts already defcribed, there is frequently added on the face, near the centre, a kind of compartment, called the quadrat, or geometrical fuare. See Quadrat.

This quadrant may be ufed in different fitmations: for obferving heights or depths, its plane mult be difpofed perpendicularly to the horizon; but to take horizontal diftances, its plane is difpofed parallel thereto. Again, heights and difances may be taken two ways, viz. by means of the fixed fights and plummet, or by the label: As to which, and the manner of meafuring angles, fec Geometry, p. G74, \&c.
2. The aftronomical quadrant is a large one, vfitally. made of brafs, or wooden bars faced with iron plates; having its limbs nicely divided, either diagonally or otherwife, into degrees, minutes and feconds; and finnifhed with two telefcopes, one fixed on the fide of the quadrant, and the other moveable abont the centre, by means of the ferew. There are alfo dented wheels which ferve to dired the inftument to any object or phenomenon.-The ufe of this curious inftrument, in taking obfervations of the fun, planets, and fixed fars, is obvious ; for bcing turned horizontally upon its axis, by means of the telefcope, till the object is feen through the moveable tclefope, then the degrese, \&c. cut by the index give the altitude required, See Astronomr, p. 587 , \& 8.
3. Coles \({ }^{2}\)

\section*{\(Q \cup A \quad[726] \quad Q U A\)}

Qualrant.
3. Cole' . quaduat is a very ufffu! infloment inventcáby Mr Benjumin Cole. It cunfifts of 6 parts, ris. the laff \(A B(\) Big. 1. ) ; the quachantal arch DE ; three vanes \(A, B, C\); and the vernitr FG . 'the flaff is a bur of wood :bout two feetlong, an inch and a quarter hoat, and of a fufficient thicknefs to prevent it from bend ng or warping. The quadrantal arch is alfo of wood; and is livided into degrees, and third-parts of a degree, to a radius of about ninc inches; to its exircmities are firted two radii, which meet in the centre of the quadrant by a pin, round which it eafly moves. 'Jhe fight-vane \(A\) is at thin piece of brats, almoft two inches in lieight and one brcad, placed perpendicularly on the end of the ftuff \(A\), hy the help of two ferews purning through its font. Through the middle of this vane is dilled a frall hole, through which the coincidence or meeting of the holizon and flar fpot is to be viewed. The horizon vane \(B\) is about an inch broad, and two inclies and a half high, having a flit cut thro' it of near an inch long and a quarter of an inch broad; this vane is fixed in the centre fin of the inftrument, in a perpendicular pofition, by the help of two fcrews paffing through its foot, whereby its pofition with refpect to the fight-vane is always the fame, their angles of in. clination being equal to 45 degrees. The fhade-vane C is compoled of two brafs plates. The one, which ferves as an arm, is about four inches and a half long, and three quarters of an ineh broad, being pinned at one end to the upper limb of the quadrant by a fcrew, abrut which it has a fmall motion; the other end lies in the arch, and the lower edge of the arm is direfted to the middle of the centre-pin; the other plate, which is properly the vane, is about two inehes long, being fixed perpendicularly to the other plate, at about half in inch difance from that end next the areh ; this vane snay be ufed cither by its thade or by the folar fpot caft by a convex lens placed therein. And, beeaufe the wood.work is often apt to warp or twilt, therefore this vane may be rectified by the help, of the forew, fo that the warping of the inftument may occation no error in the obfervation, which is performed in the following maner: Set the line \(G\) on the vernier againft a degree on the upper himb of the quadrant, and turn the forew on the baekfide of the limb forward or backward, till the hole in the fight-vane, the centre of the glafs, and the funk fpot in the horizonvane, lie in a right line.

To find the fun's altitude by this inftrument : 'furn your back to the fun, holding the inftrument by the Hatf with your right hand, to that it be in a vertical planc palling through the fun; apply your eye to the fight-vane, looking through that and the horizon-vane Eill you fee the horizon; with the left hand flide the quadrantal arch upwards, until the folar fpot or fhade, calt by the thade-vane, fall directly on the fpot or flit in the honizon-vane ; then will that part of the quadrantal areh, which is raifed above \(G\) or \(S\) (according as the obfervation refpected either the folar fpot or hade) thow the altitude of the fun at that time. But if the meridian altitude be required, the obfervation mult be continued; and as the fun approaches the meridian, the fea will appear through the horizon-vane, and then is the obfervation finifhed; and the degrees and \(\mathrm{m}^{\text {i }}\) nutes, counted as before, will give the fun's meridian
altitude: or the degrees counted from the lower limb Quadract upwards will give the zenith-diftance.
4. Adams's quadrant differs only from Cole's quadrant in having an horizontal vane, with the upper part of the limb lengthened ; fo that the glaf;, which cafts he folar fpot on the horizon-vane, is at the fame diftance from the horizon-vane as the fight-vane at the end of the index.
5. Gunter's quadrant, fo called from its inventor Edmund Gunter, befides the uftial apparatus of other quadrants, has a Atereographical projection of the fphere on the plane of the equinoctial. It has alfo a kalendar of the months, next to the divifions of the limb.

Ufe of Guntir's quadrant. I. To find the fun's metidian altitude for any given day, or the day of the month for any given meridian altitude. Lay the thread to the day of the month in the fale next the limb; and the degree it cuts in the limb is the fun's meridian altitude. Thus the thread, being laid on the 15 th of May, cuts \(59^{\circ} 30^{\prime}\), the altitude lought; and, contrarily, the thread, being fet to the meridian altitude, fhows the day of the month. 2. To find the hour of the day. Having put the bead, which flides on the thread, to the fun's place in the ecliptic, obferve the fun's altitude by the quadrant ; then, if the thread be laid over the fame in the limb, the bead will fall upon the hour required. Thus fuppofe on the roth of April, the fun being then in the beginning of Taurus, I obferve the fun's altitude by the quadrant to be \(3^{6^{\circ}}\); I place the bead to the beginning of '「aurus in the ecliptic, and lay the thread over \(3^{6^{\circ}}\) of the limb; and find the bead to fall on the hour line marked 3 and 9 ; aceordingly the hour is either 9 in the morning or 3 in the afternoon. Again, laying the bead on the hour given, having firt renified or puc it to the fun's place, the degree cut by the thread on the limb gives the altitude. Note, the bead may be retified otherwife, by bringing the thrcad to the day of the month, and the bead to the hour-line of 12 . 3. 'To find the fun's declination from his place given, and contrariwife. Set the bead to the fun's place in the ecliptic, move the thread to the line of declination, and the bead will cut the degree of declination required. Contrarily, the bead being adjufted to a given declination, and the thread moved to the ecliptic, the bead will cut the fun's place. 4. The fun's place being given, to find his right afcenfion, or contrarily. Lay the thread on the fun's place in the ecliptic, and the clegree it cuts on the limb is the right afcenfion fought. Contrarily, laying the thread on the sight afeention, it cots the fun's place in the ecliptic. 5. The fun's altitude being given, to find his azimuth, and contrariwife. Rectify the bead for the time, as in the fecond article, and obferve the fun's altitude: bring the thread to the complement of that altitude; thus the bead will give the azimuth fought, among the azimuth lines. 6. To find the hour of the night from fome of the five ftars laid down on the qua. drant. (1.) Put the bead to the flar you would obferve, and find how many hours it is off the meridian, by article 2. (2.) Then, from the light afcenfion of the far, fubtract the fun's right afcenfion converted into hours, and mark the difference; which difference, added to the obferved hour of the flar from the meri- meridian, which is the hour of the night. Suppofe on the 15 th of May the fun is in the fth degrce of Gemini, I fet the bead to Areturus; and, obterving his altitude, find him to be in the weft about \(50^{\circ}\) high, and the bead to fall on the hour line of 2 in the afternoon; then will the hour be 11 hours 50 minutes paft moon, or to minutes thort of midnight: for \(62^{\circ}\), the fun's right afeenfion, conserted ir:to time, makes 4 hours 8 minutes; which, fubtrasted fiom 13 hours 58 minutes, the right afcention of Aretirus, the renminder will be 9 hours 50 minutes; which adeled to 2 hours, the obferved diftance of Areturus from the meridian, fhows the hour of the night to be it hours 50 mi nutes.

The mural quadrant has already beendefcribed under the article Astronomy, \(11^{\circ} 497\). It is a molt important inltrument, and has of late been much improved by Mr Ramfden, who has diftinguithed himfelt by the aecuraes of his divifions, and by the manner in which he finithes the planes by working them in a vertical pofition. He places the plumb-line behind the inftument, that there may be no neecflity for removing it when we take an obfervation near the zenith. His manner of fufpending the glafs, and that of throwing light on the object-glafs and on the divitions at the fame time, are new, and improvements that deferve to be noticed.Thofe of eight feet, which he has made for the oblervatories of Padua and Vilna, lave been examined by Dr Mafkelyne ; and the greatelt error does not exceed two feconds and a half. That of the fame fize for the otfervatory ot Milan is in a very advanced Rate. The mural quadrant, of fix feet, at Blenheim, is a moft admirable inftrument. It is fixed to four pillars, which turn on two pivots, fo that it may be put to the north and to the fouth in one minute. It was for this inftrument Mr Ramflen invented a method of rectifying the are of 90 degrees, on which an able aftronomer had ftarted fome difficulties; but by means of an horizontal line and a plumb-line, forming a kind of crof:, without touching the circle, he fhowed him that there was not an error of a fingle fecond in the 90 degrees; and that the difference was occaioned by a mural quadrant of Bird, in which the arc of 90 degrees was too great by feveral feconds, and which had never been rectified by fo nice a method as that of Mr Ramfden.

But the quadrant is not the inftrument which ftands higheft in Mr Ramfden's opinion; it is the complete circle: and he has demonftrated to M. de la Lande, that the former mult be laid afide, if we would arrive at the utmof exactnefs of which an obfervation is capable. His principle reafons are: r. The leaf variation in the centre is perceived by the two diametrically oppofite points. 2. The circle being worked on the turn, the furface is always of the greatef accuracy, which it is imponible to obtain in the quadrant. 3. We may always have two meafures of the fame are, which will ferse for the verification of each other. 4. The firf point of the divifion may be verified every day with the ntmof facility. 5. The dilatation of the metal is uniform, and cannor produce any error. 6 . This inftru. ment is a merididn glafs at the fame time. 7. It alfo becomes a moveable azimuth circle by adding an hori-
zontal circle bencath its axis, and then gives the refrac- शundaato tions independent of the menfiration of time.
6. Hadley's quadrant is an inftrument of vath utility both in navigation and practical aftronomy. It derives its name from Mr Hadley, who firt publified an account of it, though the firlt thouglit originated with the eelebrated Dr llooke, and was eompleted by sia: Ibac Newton (fec Astronomy, no 32. and alli) no \(1 \%\) and 22.) The utility of this quadrant arifes from the accuacy and precifion with which it enables us to determine the latitude and longitude; and to it is navig.ttion much indebted for the very great and rapid advarices it has made of late years. It is eafy to manage, and of extenfive ufe, requiring no peculiar fleadinefs of hand, nor any fuch fised bafis as is neetfisty to other aftionomical interuments. It is ufed as an inflrument for taking angles in maritime furveying, and with equal fiacility at the maft head as upon the deck, by which its fphere of obforvation is much extended; for fuppofing many ifands to be vibible from the maft head, and only one from deck, no ufeful obervation can be made br any other inferunent. But by this, angles may be taken at the malt head fiom the one vilible obje? with great exactnefs; and further, taking angles from heights, as hills, or a fhip malt's heal, is almot the only way of exactly defcribing the figure and extent of fhoals.

It has been objected to the ufe of this inftrument for furveying, that it does not meafure the horizontal angles, by which alone a plan can be laid down. This utjection, however true in theory, may be reduced in prastice by a little caution; and Mr Adams has given. very good directions fur doing fo.

Notwithftanding, however, the manifelt fuperiority of this inftrument over thofe that were in ufe at the time of its publication, it was many years before the failors could be perfuaded to adopt it, and lay afide their imperfeat and inaecurate inftruments; fo great is the difficulty to remove prejudice, and emancipate the mind tr \(m\) the flavery of opinion. No inftrument has undergone, fuce the original invention, more changes than the quadrant of Hadley; of the various alterations, many had no better foundation than the caprice of the makers, who by thefe attempts have often ren. dered the inflrument more complieated in conftruction, and more dificult in ufe, than it ras in its original tate \({ }_{\text {a }}\)

It is an effential property of this inftrument, derived frem the laws of eflection, that half degrees on the arch anfwer to whole ones in the angles meafured: hence an oftant, or the eighth part of a circle, or 45 degrees on the arch, ferves to meafure 90 degrees; and fextants will meafnre an argular diftance of 120 degrees, tho \({ }^{2}\) the arch of the inftument is no more than 60 degrees. It is from this property that foreigners term that inftrument an obant, which we ufually call a guadront, and which in effect it is. This property reduces in. deed confiderably the bulk of the inftrument: but at: the fame time it calls for the utmolt accuracy in the divitions, as every error on the atch is doubled in the obfervation.

Another effential, and indeed an invaluable, propera ty of this inftument, whereby it is rendered peculiarly. advantageous in matine cbervations, is, that it is not
hiable o" his inltuncent, no motion nor vacillation of the flip will irjure his olfervation.

Thirdly, the eyrers to which it is liable are eafily difcovered and readily rectified, while the application and ufe of it is facile and pain.
To find whethe: the two furfaces of any one of the reflecting glaffes be parallel, apply your eye at one ond of it, and obfenve the image of dome object reflected very obliquely from it ; if that imare appears fingle, and well-defined about the ediges, it is a proof that the intaces are parallel: on the contrary, if the edge of the reforted images appear milted, as if it threw a fhudow from it, or feparated like two edges, it is a proof that the two furfaces of thee glafs ate inclined to each other: if the image in the fpeculum, particulaty if that image be the fun, be viewed through a fmall teleforpe, the csamination will be more perfect.

To bind whether the furface of a reflecting glafs be plane. Choofe two diftant objefts, nearly on a level with each other; hold the inftrument in an horizontal yofition, view the left hand olject directly through the tranfparent part of the horizon-glafs, and move the index till the reflected image of the other is feen below it in the filvered part: make the two images unite juft at the line of feparation, then turn the inftrument round flowly on its own plane, fo as to make the united images move along the liae of feparation of the horizon-glats. If the images continue unied without receding from each other, or varying their refpective pofition, the refiecting furface is a grod plane.

To find if the two furfaces of a red or darkening glafs are parallel and perfectly plane. This muft be done by means of the fun when it is near the meridian, in the following manner: hold the fextant verticaliy, and direat the light to fome object in the horizon, or between you and the fky , under the fun; turn down the red glafs and move the index till the reflected image of the fin is in contact with the objeat feen directly: fix then the index, and turn the red glafs round in its fquare frame ; view the fun's image and objeet immediately, and if the fun's image is neither raifed nor deprefled, but continues in contact with the object below, as before, then the furfaces of the darkening glafs are true.

For a more particular defcription of Hadley's quadrant, and the mode of ufing it, fee Natigation, Book II. Chap. I.
This infrument has undergone feveral improvements fince its firft invention, and among thefe improvers mult be ranked Mr Ramiden. He fonnd that the eflential parts of the quadrant had not a fufficient degree of \(\%\). lidity; the friction at the centre was too great, and in gener:l the alidada might be moved feveral minutes without any change in the pofition of the mirror; the diviliens were conmonly very inaccurate, and Mr Ramiden found that Abbe de la Caille did not exceed the truth in eflimating at five minutes the ervor to which an ubferver was liable in taking the diflance between the moon and a far; an crror capzole of producing a mitake of 50 leagues in the longitude. On hais account Mr Ramfden changed the principle of conlruc-
tion of the centre, and made the intrument in fuch a manner as never to give an error of more than half a minute ; dad he has now brought them to fuch a degree of perfection as to warrant it not more than tix feconds in a quadrant of fifteen inches. Sirce the time of having improved them, Mr Ramiden has contrueted an immenfe number; and in feveral which have been carried to the Eaft Indics and America, the deficiency has been found no greater at their return than it had been determined by examinations before their being taken out. Mr Ramiden has made them from 15 inches to an inch and a half, in the latter of which the minutes are eafly ditinguilhable ; but he prefers for general ure thofe of to inches, as being more eafily handicd than the greater, and at the fame time capable of equal accuracy. See Sextant.

A great improvement was alfo made in the con. Struation of this quadrant by Mr Petci Dollond, famous for his invention of achrematic telefenpes. The glaffes of the quadrants thould be periect planes, and have their furfaces perfeatly parallel to one another. By a praatice of feveral years, Mr Dollond iound out methods of grinding them of this form to grcat exactnefs; but the advantage which flould lave arifen from the goodnefs of the glaffes was often defeated by the index-glafs being bent by the frame which contains it. To prevent this, Mr Doiland contrived the frame fo that the glafs lies on three points, and the part that Frefies on the front of the glafs has alfo three points oppofite to the former. Thete points are made to confine the glafs by three forews at the back, acting dircaty oppoite to the points between which the glafs is placed. The principal improvements, however, are in the methods of adjufting the glaffes, particularly for the back-obfervation. The niethod formerly practifed for adjulting that part of the infrument by means of the oppofite horizons at fea, was attended with fo many difficulties that it was fearce ever ufed : for fo little dependence could be placed on the obfervations taken this way, that the belt Hadley's fextants made for the purpofe of obferving the diftances of the moon from the fun or fixed ftars have been always made without the horizon-glafs, for the back obfervation; for want of which, many valuable obfervations of the fin and moon have been loft, when their diftance exceeded 120 degrees. To make the adjuftment of the back-obfervation eafy and exact, he applied an index to the back horizon-glafs, by which it may be moved in a parallel pofition to the index-glafs, in order to give it the two adjuftments in the fame manner as the fore-horizon-glafs is adjufted. Then, by moving the index to which the back-horizon-glafs is fixed exactly 90 degrees (which is known by the divitions made for that purpore), the glafs will thercby lee fet at right angles to the indexglafs, and will be properly adjufted for ufe; and the onfervations may be made with the fame accuracy by this as by the fore-obervation. To adjuft the horizonollaffes in the perpendicular pofition to the plane of the inftrument, he contrived to move each of them by a lingle fcrew, which goes through the frame of the quadrant, and is turned by means of a milled head at the hack; which may be done by the obferver while he is looking at the object. To thefe improvements alfo

\section*{QUA [ 729 ]}
rant. he added a method invented by Mr Mafkelyne, of placing darkening-glaffes behind the horizon-glaties. 'Thefe, which ferve for darkening the object feen by direat vifion, in adjulting the inftrument by the fun or mean, he placed in fuch a manner as to be turned belind the fore horizon-glafs, or behind the back horizon-glafs: there are three of thefe glaffes of different degrecs of d:rknefs.

We have been the more particular in our defcription and ufe of Hadley's quadrant, as it is undoubtedly the beft hitherto invented.
7. Horodiçical quadrant, a pretty commodious infrument, fo called from its ufe in telling the hour of the day.-Its confruction is this: From the centre of the quadrant, C , fig. 3 . whore limb \(A B\) is divided into \(90^{\circ}\), defcribe feven concentric circles at intervals at pleafure; and to there add the figns of the zodiac, in the order reprefented in the figure. Then applying a ruler to the centre C and the limb AB , mark upon the feveral parallels the degress correfponding to the altitude of the fun when therein, for the given hours; conned the points belonging to the fame hour with a curve line, to which add the number of the hour. To the radius CA fit a couple of fights, and to the centre of the quadrant C tie a thread with a plummet, and upon the thread a bead to flide. If now the thread be brought to the paralkel wherein the fun is, and the quaelrant directed to the fun, till a vifual ray pafs through the fights, the bead will fhow the hour ; for the plummet, in this fituation, cuts all the parallels in the degrees correfponding to the fun's altitude. Since the bead is in the parallel which the fun defcribes, and through the degrees of altitude to which the fun is elcvated every hour there pars hour-lines, the bead muft fhow the prefent hour. Some reprefent the hour-lines by arches of cireles, or even by ftraight lines, and that without any fenlible error.
8. Sutton's or Collins's quadrant (fig. 4.) is a Rereographic projection of one quarter of the fphere between the tropics, upon the plane of the eeliptic, the eye being in its north-pole: it is fitted to the latitude of London. The lines running from the right hand to the left are parallels of altitude; and thofe croffing them are azimuths. The lefter of the two circles, bounding the projection, is one fourth of the tropic of Capricorn ; the greater is one fourth of that of Cancer. The two ecliptics are drawn from a paint on the left edge of the quadrant, with the eharacters of the figns upon them; and the two horizons are drawn from the fame point. The limb is divided both into degrees and tine; and, by having the fun's altitude, the hour of the day may be found here to a minute. The quadrantal arches next the centre contain the calendar of months; and under them, in another arch, is the fun's declination. On the projection are placed feveral of the moit noted fixed fars between the tropies; and the next below the projection is the quadrant and line of fhadnws. - To find the time of the fun's riing or fetting, his amplitude, his azimuth, hour of the day, \&ic. by this quadrant : lay the thread over the day and the month, and brng the bead to the proper ecliptic, either of fummer or winter, according to the feafon, which is called reaifying; then, moving the thread, bring the bead to the horizon, in which cafe the thread will cut the limb in the time of the fun's rifing or fetVol. XV.
ting before or after fix; and at the fame time the bead Cuadrant. will cut the horizon in the degrees of the finn's ampli-tude-Again, obferving the fun's altitude with thic quadrant, and foppofing it found \(45^{\circ}\) on the fifth if May, lay the thread over the fifth of May, bring the bead to the funmer ccliptic, and carry it to the paralle of altitude \(45^{\circ}\); in which cafe the threal w.ll cut the limb at \(55^{\circ} 15^{\prime}\), and the hour will Io feen amoung the hour-lines to be either 41' paft nine in the morning, or \(19^{\prime}\) paft two in the afternoon.- Iaily, the bead among the azimuths fhows the fin's diatace from the fouth \(50^{\circ} 41^{\prime}\). liue nnte, that if the fun's altitude be lefs than what it is at fix n'cloct:, the open:ation muft be performed among thofe parallels above the upper horizon; the bead being rectificd to the winter ecliptic.
9. Sinical quadrant (fig. 5.) confift of feveral coneentrie quadrantal arches, divided into eight equal parts by radi, with parallel right lines ernfing each nther at right angles. Now any one of the arches, as DC, may repreient a quadrant of any great circle of the fphere, hut is chicfly ufed for the horizon or meridian. If ulen 13C be taken for a quadrant of the horizon, either of the fides, as \(A B\), may reprefent the meridian; and the other fide, AC, will reprafent a parillel, or line of eaft and weft : and all the other lines, parallel to \(A \mathrm{~B}\), will be alio meridians; and all thofe parallel to AC , ealt and weft lines, or parallels.-Again, the eight fasces into which the arches are divided by the radii, reprefent the eight points of the compafs in a quarter of the horizon; each containing \(11^{\circ} 15^{\prime}\). The arch BC is likewife divided into \(90^{\circ}\), and each degree fubdivided into \(12^{\prime}\), diagonal-wife. To the centre is fixed a thread, which, being laid over any degree of the quadrant, ferves to divide the horizon.

If the finical quadrant be taken for a fourth part of the meridian, one fide thereof, AB , may be taken for the common radius of the meridian and equatur; and then the other, AC, will be half the axis of the world. The degree of the circumference, \(B C\), will reprefent degrees of latitude; and the parallels to the fide \(A B\), anlumed from every point of iatitude to the axis AC , will be radii of the parallels cf latitude, as liketrife the fine complement of thofe latitudes.

Suppofe, then, it be requirel to find the degrees of longitude contained in 83 of the lefier leagues in the parallel of \(48^{\circ}\); lay the thread over \(48^{\circ}\) of hatitucle \(n\) the circumference, and count thence the 83 leagues 12 \(A B\), beginning at \(A\); this will terminte in \(H\), ailuwing every fmall interval four lengues. Then tracing out the parallel HE , from the point H to the thread; the part \(A \mathrm{E}\) of the thread thows that 125 greater or equinoctial iea gues make \(6^{0} 15^{\prime \prime}\); and therefore that the 83 leffer leagues AH, which make the difference of hangitude of the courfe, and are equal to the radius of the parallel HE, make \(6^{\circ} 15^{\prime \prime}\) of the faid parallel.

If the hip fails an oblique courfe, fuch c urfe, befides the north and fouth greater leagues, gives leffer leagues cafterly and wefterly, to be reduced to degrees of longitude of the equator. Bur thefe leagne; being nade neither on the parallel of departure, ner on that of arrival, but in all the intermediate cass, we muft find a mean proportional parallel between them. To find this, we hate on the influment a feale of crovs latitudes. Suppofe then it were requred to find a

4 Z
ree :s mean parallel between the parallels of \(40^{\circ}\) and \(60^{\circ}\) and 6 oth degree on this fcale: the middle point will terminate againft the 51 ft degree, which is the mean parallel required.

The principal ufe of the finical quadrant is to form thiangles upon, fimilar to thofe made by 2 flip's way with the meidians and parallels; the fides of which triangles are meafured by the equal intervals between the concentric quadrants and the lines \(N\) and \(S, E\) and W: and every fifth line and arch is made deeper than the reft. Now, fuppofe athip to have falled 150 leagues north-caft, one fourth noth, which is the third point, and makes an angle of \(33^{\circ} 44^{\prime}\) with the north part of the meridian: hete are given the courfe and diftance tiailed, by which a triang!e may be formed on the ins. ftrment fimi'ar to that made by the thip's courfe; and hence the unknown parts of the triangle may be found. Thus, fuppoling the centre \(A\) to reprefent the place of departure ; count, by means of the concentric circles along the point the hhip failed on, viz. AD, 150 leagues: then in the triangle \(A E D\), fimilar to that of the ihip's courfe, find AE=difference of latitude, and DE=difference of longitude, which mut be reduced according to the parallel of latitude come to.
10. Gunner's quadrant ( Gig. 6.), fometimes called gumier's fquare, is that ufed for elevating and pointing canuen, mortars, \(\mathbb{E c}\). and confilts of two branches either of brafs or wood, between which is a quadrantal arch divided into go degrees, beginning from the thor ter branch, and furnifhed with a thread and plummet, as reprefented in the figure. -The ufe of the gunner's quadrant is extremely eafy; for if the longeft branch be placed in the mouth of the picce, and it be elevated till the plummet cut the degree necelfary to hit a propofed object, the thing is done. Sometimes on one of the furfaces of the long branch are noted the divifion of diameters and weights of iron bullets, as alfo the bores of pieces.

Quabiant of Altitud, is an appendage of the artificial globe, conliting of a lamina, or nip of brats, the length of a quadrant of one of the great circles of the globe, and graduated. At the end, where the divii:on terminates, is a nut rivetted on, and furnifhed with : ferew, by means wheref \(f\) the inftrument is fitted on the meridian, and moveable round upon the rivet to all points of the horizon.-Its ufe is to ferve as a fcale in meafutitg of altitudes, amplitudes, azimuths, \&c. See Astronomy, \(n^{\circ} 379\), \&ic.

QUADRANTAL, in antiquity, the rame of a veflel in nfe among the Romans for the meafuring of liquids. It was at firt called amplora; and afterwards qua irantal, from its form, which was fquare every way like a die. Its capariy was So libre, or pounds of water, which made 48 fextaries, two unx, or eight congii.

QUADRA'T, a mathematical inftument, called alfo 2 Gemetrial Square, and lize of Shatoa's: it is freque:tly an additional member on the face of the common quadrant, as alfo on thofe ot Gunter's and Sutton's quadiants. Sez Geomrtry, p. 672. and Plate CCXVII. fig. 1 - 5 .

Quanrat, in printing a piece of metal ufed to fill of the veid faces between words, \&ec. There are gua-
drats of different fizes; as m-quadrats, n-quadrats, \&cc. Qua which are refpectively of the dimenfions of thefe letters, only lower, that they may not receive the ink.

QUADRATIC EQuations, in algebra, hofe wherein the unknown quantity is of two dimenfions, or raifed to the fecond power. Sce A lgebra.

QUADRATRIX, in geometry, i mechanical line, by means whereof we can find right lines equal to the circumference of circles, or other curves, and their feveral parts.

QUADRATURE, in geometry, denotes the fquaring, or reducing a tigure to a fquarc. Thus, the finding of a fquare, which thall contain juft as much furface or area as a circle, an elliphis, a triangle, \&c. is the quadrature of a circle, elliplis, \&c. The quadrature, efpecially among the ancient mathematicians, was a great poltulatum. The quadrature of reftilineal figures is eatily found, for it is merely the find ng their areas or furfaces i. \(e\). their fquares; for the fquares of equal areas are eatily found by only extracting the ronts of the areas thus found. See Geomerry, l'art II. chap. 3. The quadrature of curvilinear faces is of more difficult inveftigation; and in this refpect extremely little was dene by the ancients, except the finding the quadrature of the parabola by Archimedes. In 1657. Sir Paul Neil, Lord Brouncker, and Sir Chrifopher Wren, geometrically domonftrated the equality of forme curvilinear fpaces to rectilinear faces; and foon after the like was proved both at home and abruad of 0 her curves, and it was afterwards brought under an amalytical calculus; the firlt fpecimen of which was given to the public in 1688 by Mercator, in a demonttration of Lord Brouncker's quadrature of the hyperbold, by Dr Wa!!is's reduction of a fraction into an infinite feries by divifion. Sir Ifac Newton, however, had before difcovered a method of attaining the quantity of all quadiuple curves analytically by his fluxions before 1668. It is difputed between Sir Chriftopher Wren and Mr Huygens which of them firf difcovered the quadrature of any determinate cycloidal fpace. Mr Leibnitz afterwards found that of another fpace; and in 1669 Bernoulli difcovered the quadrature of an infinity of cy. cluidal fipaces both fegments and fectors, Scc. See Gaometry, Part II. chap. 3. prop. 33.; and Fluxions, p. 314.

Quadrature, in aftronmy, that afpect of the moon when the is \(90^{\circ}\) diltant from the fun ; or when the is in a middle puint of her orbit, between the points of conjunction and oppofition, namely, i:1 the firt and thind quarter:. See Astronomy, \(\mathrm{n}^{\circ} 320\), \&ic.

QUADRA['US, in anatumy, a name given to feverit mufcles on account of their fquare figure. Sec Anatomy, Talle of ibe Muflis.

QUADREL, in building, a kind of a:tificial fone, fo called fiom its being perfestly fquare. The quadrels are made of a chalky earth, \&c. and dried in the fhade for two years. "Wheie ware furmerly in great requelt among the I alian architeets.

QTADRIGA, in antiquity, a car or chariot drawn by lour horfes. On the reverfes of madals, we frequently fee che emperor or Vitory in a quadriga, hold. ing the reins of the horfe; whence thefe coins are, among the curious, called uanmi quastrigati, and viano riais

QUADRILATERAL, in geometry, a figure whofe perinueter consills of four fides and four angles; whence it is alfo ralled a cuddraryular figure.

OUADRILLE, a litt'e troop or company of cavalicrs, pompoutly drelled, and mounted for the pelformance o. carondals, julls, tournaments, runuings at the ring, and oilor gallant disertifements.

Quadrille, a gime phayed by four perfons, with 40 curds; which ale the remains of a pack, after the four tens, nimes, and enghes are dicarded; thefe are dealt three and three, and one round four, to the sight hand player ; and the trump is made by him that plays with or withou: calling, by naming \(f_{1}\) ades, clubs, diamonds, or hearts, and the fait named is trumps. If the perfon who names the trump theuld mittake, and fay fpades inftead of clubs, or if he name two fuits, the firft named is the tiump.

In this game the o. der of the cards, aceording to their natural value, is as follows: of hearts and diamonds, king, quect, krave, ace, deuce, three, four, five, fix, fiven; in all 10 ; of fiades and clubs, king, quen, knave, feven, for, fore, four, there, deace; in all 9 . The reafon why the ace of fpades and ace of clubs are not mentioned, is, becoufe they are always trumps, in whatever fuit that is flayed. The ace of fpades being always the firt, and the ace of clubs the third trump, for the cards ranked according to their value when trumps fland in the fullowing order.

Hearts and diamonds spadill, or the ace of fpades; hanill, the feventh of the two red fuits; basto, the ace of clubs; ponto, the ace of bearts and diamonds; king, quefn, lnave, deuce, three, four, five, fix; in all 12. Spades and clubs, spadill the ace of fpades, Mavill the deuce of fades and clubs, basro the ace of elubs; king, quecn, knave, feven, fix, five, four, three; in all II. It is here to be obferved, that the card which is manill and the fecond trump, is always the loweft in its fuit when not trumps; and that the ace of hearts or diamonds, which when trump is above the king, is beiow the knave when not trump.

There are three matadores ; fpadill, manill, and bafo; the privilege of which is, that when the player has no nther trumps but them, and trumps are led, he is not obliged to play them, but may play what card he thinks proper, provided, however, that the trump led is of an inferior rank; but if fpadill hould be led, he that has manill or batto only, is obliged to play it; it is the fame of manill, baft, with refpect to the fuperior matadore always forcing the inferior. Though there are properly but three matadores, neverthelefs, all thofe trumps which follow the three firf without interruption, are likewife called matadores; but the three firt only enjoy the privilege abovementioned.

Each perfon is to play as he judges moft convenient for his own game. He is not to enccurage his friend in play ; but each perfon ollght to know what to do when it is his turn to play. The fakes confit of feven equal mils or contrats, as they are fometimes called, compriling the ten counters and fithes, which are given to each player. A mil is equal to ten fifh, and each
fill to ten counters: the value of the fifh is according
to the players agreement, as alfo the number of tours, whien are generally fixed at ten, and marked by turn. ing the comers of a c.ird.

If the cards fhou'd happen \(n^{n} t\) to be dealt right, or that there hould be two cards of the fante lort, as two dences of pades, for example, thare malt be e new de.l; provided it is difonered before the eard: are all played. The cards mutt linew fe be dealt over again in cafe a card is turned in daaling, as it mighat he of prejudice to him who thould have it; and of courfe if there fhould be feveral cards turned. There is no penalty for dealing wrong, he who does fo mult only deal again.

When each plager has got his ten cards, he that is on the right hand of the dealer, after examining his game, and finding lis hand fit to play, aks if the \(\boldsymbol{J}\) play; or if he has not a good hond, he pulfes, and fo the fecond, third, and fourth. All the four may pals ; but he that has fpadill, after having hown or named it, is obliged to play by calling a king. Whether the deal is played in this manner, or that one of the players has anked leave, nobody chooling to play without calling, the eldeft hand mult begin the play, firt naming his fuit, and the king which he calis; he who wins the trick plays another card, and fo of the reft till the game is finifhed. The tricks then are counted; and if the ombre, that is, he who fands the game, has, together with him who is the king called, fix tricks, they have won and are paid the game, the confolation, and the matadores, if they have them, and divide what is upon the game, and the bealts if there are any. But if they make only five tricks, it is a remife, and they are beafted, what goes upon the game, paying to the other players the confolation and the natadores. It the tricks are equally divided betwixt them, they are likevife beatted; and if they make only four tricks between them, it is a remife; if they make lefs they lofe codill ( \(A\) ), and in that cafe they pay to their adverfaries what they thould have received if they had won; that is, the game, the confolation, and the matadores, if they have them, and are beafted what is upon the game : they who win codill, divide the ftakes. The beatt, and every thing elfe that is paid, is paid equally betwixt the two lofers; one half by him that calls, and the other half by him that is called, as well in cafe of codill as a remife : unlefs the ombre does not make three tricks, in which cafe he that is called is not only exempted from paying half the beatt, but alfo the game, the confolation, and the matadores if there are any, which the ombre in that cafe pays alone; and as well in cafe of a codill as a remife. This is done in order to oblige players not to play games that are unreafonable. There is, ne. verthelef, one cafe in which if the ombre makes only one trick, he is not bealted alone, and that is, when not laving a gond hand he palfes, and all the other players have paffed likewile; he having fadill is obliged to play. Here it would be unjuft to obiige him to make three or four tricks; in this cale, therefore, he that is 4 Z 2
called
(1) Codill is when thofe who defend the pool make more tricks than they who fand the game; which is callud mu:ning the coitll.

Duadrille. called pays one half of the lofings. For which reafon he that has fpadill with a bad liand, thould pais, that if he is afterwards obliged to play by calling a king (which is called forced Jpadill), he may not Le bealted alone. He that has once patled cannot be admited to play ; and he that has alked leave cannot refufe to piay, unlefs any onc thould offer to play without cilling.

He that lias four kings, may call a queen to one of his kings, except that which is trump. He that wants one or more kings, may call one of thofe kings ; but in that cafe, he muft make fix tricks alone, and confequently he wins or lofes alone. The king of that fuit in which he plays cannot be called. No one thould play out of his turn, although he is not beatted for fo doing. If he who is not the eldeft hand has the king called, and plays fpadill, manill, or batto, or even the king called in order to fow that he is the friend, having other kings that he fears the ombre flould trump, he is not to be allowed to go for the vole; he is even beafted, if it appears to be done with that intent. It is not permitted to fhow a hand though codill may already be won; that it may be feen whether the ombre is bealted alone. If the ombre or his friend fhows their cards before they have made fix tricks, thinking that they have made them, and there appears a pollibility of preventing their making them, the other players can oblige them to play their cards as they think proper.

A player need only name his fuit when he plays, without calling a king. He who plays without calling mult make fix tricks alone to win for all the other players are united againd him, and they are to do what they can to prevent his winning. He who plays without calling, is admitted to play in preference to him who would play with calling; however, if he that has alked leave will play without calling, he has the preference of the other who would force him. Thefe are the two methods of play without calling that are called forced.

As he who plays without cailing does not divide the winnings with any perfon, lie confequently, when he lofes, pays all by himfelf; if he lofes by remife he is beatted, and pays each of the other players the confolation, the fans appeller (which is commonly, but improperly, called the fans prendre), and the matadores if there are any; if he lofes codill he is likewife beafted, and pays to each player what he would have reccived from each it he had won. They who win codill divide what there is; and if there are any counters remaining, they belong to him of the three who fhall have fpadll or the higheft trump the next deal. It is the farne with regard to him who calls one of his own kings, he wins alone or lofes alone as in the other cafe, except the fans appeller, which he does not pay if he lofes, or receive if he wins, although he plays alone.

If he plays fans appeller, though he may have a fure game, he is obliged to name his fuit; which if he negle its to do, and fhows his cards, and fays, "I play fans appeller;" in that cafe either of the other players can oblige him to play in what fuit he pleafes, although he thould not have one trump in that fuit.

He who has anked leave is not permitted to play fans zpreller, unlefs he is forced; in which cafe, as was
faid before, he has the preference of the other that Quad forces him.

A player is not obliged to trump when he has none of the fuit led, nor play a higher card in that fuit if he has it, being at lis option although he is the latt player, and the trick fhonld belong to the ombere; but he is obliged to play in the fuit led if he can, otherwife he renounces. If he feparates a card from his game and fhows it, he is obliged to play it, if by not doing it the gsme may be prejudiced, or if it can give any intelligence to his friend; but efpecially if it fhould lee a matadore.-He that plays fans appellor, or by calling himfelf, is not fubject to this law. He may furn the tricks made by the other players, and count what has been played as often as it is his turn to play, but not otherwife. If inftead of turning a player's tricks, he turns and fees his game, or hows it to the other players, he is beafted, together with him whofe cards he turned; and each of them mult pay one half of the bealt.

If any one renounces, he is beafted as often as he has renounced and it is detected; but a renounce is not made till the trick is turned. If the renounce is difo covered tefore the deal is finifhed, and has been detrimental to the game, the cards muft be taken up again, and the game replayed from that trick where the re. nounce was made ; but if the cards are all played, the beaft is fill made, and the cards mult not be replayed; except there fhould be feveral renounces in the fame deal: then they are to be played again, unlefs the cards fhould be mixed. If feveral bealts are made in the fame deal, they all go together, unlefs it is otherwife agreed at the beginning of the party; and when there ane feveral beafts, the greateft always goes firf.

A great adrantage accrues from being eldeft hand at quadrille, which often tenders it very difagreeable to the relt of the players, being obliged to pafs with a good hand unlefs they choofe to play alone; and when it happeus that the eldeft hand having alked leave, the fecond player has three matadores, feveral crumps in back, and all fmall cards, he cannot then even play alone; and having no chance of being called, he muit pafs with this good hand. On account of which, this method has been thought expedient to remedy this defect of the game; each player having an opportunity of availing himfelf of the goodnefs of his game, by adding to the utual method of playing the game that of the mediateur, and the favourite fuit.

The firtt thing to be obferved is that of drawing for places, which is done in this manner: One of the players takes four cards; at king, a queen, a knave, and an ace ; each player draws one of thete cards; and commonly he who comes in laft, draws firt. The perfon who draws the king fits where be pleafes, the queen at his right hand, the knave next the queen, and the ace on the lett of the king. The king draws the favourite fuit. The number of cards and perfons is the fame at this game as the other, and is played in the fame mamer.

The favourite fuit is determined by drawing a card out of the pack, and is of the fame fuit, during the whole party, of the card fo drawn.

A king is the mediateur, which is demanded of the others by one of the players, who has a hand he ex-

Fects to mate five tricks of; and through the affinance of this king he can play alone and make fix tricks.

In return for the king received, he gives what card he thinks proper with a fith; but mult give two fill if it is in the favourite fuit. He who alks by calling in the favourte fuit, has the preference to him who afks by calling in any other; he who afks with the mediateur, has the preference to him who atks by calling in the favourite fuit, and by playing alone is obliged to make fix tricks to win. He who anks with the mediateur in the favourite fuit, has the preference to him who alks with the mediateur in any other fuit, and is obliged to play alone, and to make fix tricks.

If fans prendre is played in any other fuit than the facourite, he who plays it has the preference to him who atks only, or with the mediateur, or even he who plays in the fivourite fuit with the mediateur; and the fons prendre in the favourite fuit has the preference to all other players whatever.

The only difference between this method of playing the game and the other is, that when one of the playcrs demands the medateur he is obliged to play alone, and to make fix tricks, as if he played fans prendre. In this cafe he thould judge from the ftrength of his hand, whether the aid of the king will enable him to play alone or not.

With the mediateur and without the favourite fuit it is played in this manner. The game is marked and played the fame as in common, except that a fith extraordinary is given to him who plays the mediateur, and to him who plays fans prendre; that is, he who wins the mediateur receives \(I_{3}\) counters from each; and if he lores by remife he pays 12 to each; ard 13 if by codill. The winner of fans prendre receives 17 counters from each; and if by remide he lofes, he pays 16 to each : and 17 if by codill.

The vole with the mediateur receives one fin only, as at common quadrille. The beats are alfo the fame as the common game. The laft game is generally played double, and is called poulans; but for thule who choofe to play a higher game, they may play the douhle colour, which is called the Turk, and is double of the favourite fuit. There is alfo a higher game than this called the auode, which is paying whatever is agreed to him who happens to hold the two aces in his hand.

We have omitted many things refpecting the mode of marking the game, and playing the vole, becaure thefe are different in different cafes, and are to be learned only by practice. The game itfelf is a very inferior one; but he who wifhes to know more of it, may confult Hoyle's games improved by James Beaufort, Efq; from which we have, with very little alteration, taken this article.

QUADRUPEDS, in zoology; thofe animals which have four limbs or legs proceeding from the trunk of their body. See Zoolosy; in which atticle notice will be taten of the method of preferving fpecimens of thefe and other animals.

> QUASTOR, fee Questor.
> QUAGGA, or Quacha See Equus, \({ }^{\circ} 5\).
> QUAIL, in zoology. Sce Tetrao.

Quails are to be taken by means of the call during their whole wooing time, which lafts from April to Augult. The proper times for ufing the call are at fun-rifing, at nine o'clock in the morning, at three in
the afternoon, and at fun-fet; for there are the natural times of the quail's calling. The notes of the cock and hen quail are very diferent; and the fportfman who expeets to fuccecd in the taking them mult be expert in both: for when the cock calls, the anfwer is to be made in the hen"s note; and when the hen calls, the antwer is to be made in the crek's. lis this means they will come up to the perfon, fo that he may, with great eale, throw the net over them and take them. If a coci-furib be fingle, on hearing the hen's note he will immedrately come ; but if he have a hen already with him, he will not forfake her. Sometimes, though only one quail anfwers to the call, there will three or four come up; and then it is beft to lave patience, and not run to take up the firil, but fay till they are all entangled, as they will foon be.

The quail is a neat cleanly bird, and will not run much into dirty or wet places: in dewy mornings, they will often fly inftead of ruming to the call ; and in this cafe, it is beft to let them go over the net, if it fo happens that they fly higher than its top; and the fportfman then changing fides, and caling again, the bird will come back, and then will probably be taken in the net.

The calls are to he made of a fmall leather purfe, about two fingers wide, and four fingers long, and made in the fhape of a pear; this is to be fluffed halffull ni horfe-hair, and at the end of it is to be placed a fmall whiftle, made of the bone of a rabbit's leg, or fome other fuch bone: this is to be about two inches long, and the end formed like a flageolet, with a little foft wax. 'This is to be the end faftened into the purfe; the other is to be clofed up with the farne was, only that a hole is to be opened with a pin, in malse it give a diltinct and clear found. To mate this found, it is to be held full in the palm of thec hand, with one of the fingers placed over the top of the wax ; then the purfe is to be preffed, and the finget is to Shake over the middle of it, to modulate the fonnd it gives into a fort of thake. This is the moft ufeful caill: for it imitates the note of the hen-quail, and feldem fails to bring a cock to the net if there be cne aeat the place.

The call that imitates the note of the cock, and is ufed to bring the hen to him, is to be about four inches long, and above an inch thick; it is to be made of a piece of wire turned round and curled, and covered with leather ; and one end of it mult be clofed up with a piece of flat wood, about the middle of which there muft be a fmall thread or ftrap of leather, and at the other end is to be placed the fame fort of pipe, made of bone, as is ufed in the other call. The noife is made by opening and clofing the fpiral, and gives the fame found that the cock does when lie gives the hen a lignal that he is near her.

QUAKERS, a religious fociety, which took its rife in England about the middle of the laft century, and rapidly found its way into other countries in Europe, and into the Englifi fettlements in North America.The members of this fociety, we believe, called themflves at firt feekers, from their feeking the truth; but after the fociety was formed, they alfumed the appellation of friends. The name of quakers was given to them by their enemies; and though an epithet of reproach, feems to be famped upon them indelibly. Their ioun-

\section*{QUA}

Quakers. der is generally believed to have been George Fox, an illiterate thoomaker (fee Ccorge Fox), but this opinion has been lately cintroverted. An ingenious writer \(\ddagger\) having found, or fancied, a limilarity of fentiments among the ancient Druids and modern Quakers, fecms to think that Fox mult have been nothing more than a tool employed by certain deits to pave the way for
their fyttem of natural religion, by allegorizing the diAinguilhing articles of the Chriftian faith.

It mut be confffed, for experience will not allow it to be denied, that extremes in religion are very apt to beget each other; and if the deifts alluded to reatoned from this fac, they could not have pitched upon a tool fitter for their purpofe than George Fox. From his works fill extant, he has been contidered as one of the molt extravagant and abfurd enthufiafts that ever lived, and to have fancied himfelf, in his apotolic charater, fomething infinitely fuperior to man. In a book called Norus coming out of the North (P. 15.) he fays of himfelf, "I am the Door that ever was, the fame Chrit yefterday, to day, and for ever:" And in the introduction to his Battle-door for Teachers and Profiflors, he fays, "All languages are to me no more than duft, who was before languages. were." But one of the moft extraordinary and cuitous things that he ever wrote, is an anfwer to the Protector, who had required him to promife not to difturb his government as then eftablifhed. It is as follows:
"I who am of the world called \(G: F\) doth deny the carrying or drawing any carnal fivord adainft any, or againt thee \(\mathrm{O}: \mathrm{C}:\) or any man, in the prefence of the Lord I declare it, God is my witnefs, by whom I am moved to give this forth for the truth's fake, from him whom the world calls G: Fux, zuto is the fon of Goa, who is fent to ftand a witnefs againit all violence and againft the works of darknefs, and to turn the people from darknefs to light, and to bring them from the occafion of the war and from the occafion of the magiflrates fivord, which is a terror to the evil doer, which âts contrary to the light of the Lord Fefius Chrif: which is a praife to them that do well ; which is a protection to them that do well, and not the evil; and fuch foldiers as are put in place no falfe accufers muft be, no violence muit do, but be content with their wages: and that magiftrate bears not the fword in vain, from under the occalion of that fword do I feek to bring people: my weapons are not carnal but ipiritual, and my kingdom is not of this zuorld; therefore with carnal weapon I do not fight, but am from thofe things dead, from him who is not of this world, called of the world by the name of \(G: F\) : and this I am ready to feal with my bluod; this I am moved to give forth for the truth's fake, who a witnefs ftands againft all unrighteonfiefs, and all ungodinefs, who a fufferer is for the righteous feed's fake, waiting for the redemption of it, who a crown that is morial feeks not, for that fadeth away;
which light is the condemnation of all fuch, in which light I witnefs the crown that is immortal, which fades nct away from him who to all your fouls is a fricnd, for eftablifhing of righteoufnefs, and clearing the land of evil doers, and a witnefs againt all the wicked invention; of man, and murderir's plots, which anfwer thall be with the light in all your comfciences, which makes no covenant with death ; to which light in yon all I feak, and am clear, \(\mathrm{G}: \mathrm{F}\) : who a new name hath, which the world knows not." (A).
The Quakers, however, did not long entrult the defence of their principles to fuch fenfelefs enthutialts as George Fox : They were joined by a number of learned, ingenious, and pious men, whon new-modelled their creed ; and though they did not bring it to what is generally deemed the Chritian flandard, they fo reformed it as that its tenets do not fhock common fenfe, nor the duties prefcribed fcandalize a man of piety. The chief of thefe reformers were George Keith, the celebrated Penn, and Robert Barclay. Kieith was indeed excommunicated for the liberties' which he took with the great apotle; but we have not a doult but his writings contributed to the moderation of Penn, and to the eleg.ant and mafterly apolory of B.arclay. From that apology we felected the fummary of their opinions which was given in the former edition of this work; but they have lately publifhed fuch a fummary themfeives, of which the reader will be pleafed with the following abitract:

They tell us, that about the beginning of the 17 th century, a number of men, diffatisfied with all the medes of religious worfhip then known in the world, witharew from the communion of every vifible church to feck the Loord in retirement. Among thefe was their bonourable elder George Fox, who being quickened by the immediate touches of divine love, could not fatisfy his apprehenfions of duty to God without directing the people where to find the like confolation and inftruction. In the courfe of his travels, he met with many feeking perfons in circumfances fimilar to his own, and thefe readily received his teftimony. They then give us a thort account of their fufferings and different fettlements; and with a degree of candour which dnes them great credit, they vindicate Charles II. from the charater of a perfecutor; acknowledging, that though they fuffered much during his reign, he gave as little countenance as he conld to the feverities of the legiflature. They even tell us, that he exerted his influence to refcue their friends from the unprovoked and cruel perfecutions of the New England fanatics; and they fpeak with becoming gratitude of the different afts paffed in their favour duing the reigns of William and Mary, and Genrge I. They then proceed to give us the following account of their doatrine :
"We
(A) We have tranfribed this letrer from the thenogical works of Mr Leflie, where it is preferved in its original form. The Quakers, alter the death of their apofle, cxpunged from their edition of it the words which we have printed in Italics ; ahamed, as we hope, of the Llafplemy imputed to them : but that Mr Lellie's copy is authentic, is thus attefted by two of the friends, who faw Fox deliver it to the protector's meffenger: " We are witneffes of this teflimony, whofe names in the Aelh are,

Tho. Aldam.
Rab. Craven.
"We agree with other profeffors of the Chriftian name, in the belief in one eternal God, the Creator and I'referver of the univerfe; and in Jefus Chrilt his Son, the
Meffiah, and Mediator of the new cuvenant (Hel), aii. 24).
"When we fpeak of the gracious difplay of the love of God to mankind, in the miracnlous conetption, birth, life, miracles, death, refurcetion, and afcention of our Saviour, we prefer the ufe of fiect terms as we find in Scripture ; and, contented with that knowledge which divine wiffom hath cen mect to reveal, we at tempt not in explain thofe niyiteries which remain under the vill ; neverthelef, we achnowicuge and atlert the divinity of Chrif, who is the wildom and power of God unto filvati. 11 ( 1 Cor. i. \(2_{7}\) ).
"To Chritt alone we give tiie sitle of the Word of God (Johis i. I.) and foot the scripure-; althou h we highly efteem thele facred witings, in tubordinati- \(n\) to the Spirit ( 2 Pet i. 21), from which they were given forth; and we hold, with the apofle P'ul, that they are able to make wife unto davation, though faith which is in Chrift Jefus ( 2 Tim. isi. 15).
"We reverence thofe \(m\) :i excellent precepts which are recorded in feripture to have been delvered by our great Lord, and we firmly believe that thy y ate practicable, and birdir: 5 "n every Chriftan; and that in the life to come every min will be rewarded according to his works (Mat. xri. 27). Atd tather, it is our belief, that, in order to enable mankind to put in practice thefe facted precepts, mans of which are contradien ry to the unreger.erate will of man (Johai. 9 ), every man coming into the werld is endued "ith a neieiture of the light, grace, or good Spinito: Chrilt : br which, as it is attouded tr, he is en bled to dininenifh gene from evil, and to carreat the di:orderly pations and corrupt propenfi.ies oflitis nature, which mere reafon is altogether infufficient in overcome. For all that belorgs to man is fallible, within the reach fitemptation; but this divme arace, which comes by Him who hath overcome the world ( John xvi. 33 ) is, to thofe who humbly and fincerely feek it, an all fufficient and pretent help in time of need. By this the finares of the enemy are detefed, his alluremeits avsided, and deliverance is experienced through faith in its effectual uperation ; whereby the foul is tranllated out of the kingdom of darinetis, and from under the power of Satan, into the marvellous light and kingdom of the Sm of God.
" Being thus perfuaded that man, without the Spirit of Chrilt inwardly revcaled, can do anthing to the glory of Goci, or to effect hiscomf falv.rion; we taink this infuence efpecialy neceffary to the performance of the higheft at of which the human mind is capable, even the werntip of the Father of lights and of fipirits, in fipit and in truth : therefore we conlider as oblinuctions in pure worlhip, all forms which divert the attention of the mind trom the fecret influence of this unct on frem the Holy O: C ( 1 J han ii. 20, 27). Yet, alhough true wornip is not confined to time and plate, we think it incumbent on Chriftians to meet offen togeth \(r\) (Fieb. x. 25.) in telimony of their depend: nce on the he venly lather, and for a renewal of their fpiritu \(=1\) frens \(t .1\) : neverthelef, in the performance of wor1hip, we dare not dep nd, tor "ur acceptance with Him, on a tom mat repetitom of the wird, and experiences of others; but we b.heve is to be our duty to ceaic fiom
he activity of the imagination, and to wait in filence to lave a true fight of our condition befowed upon us: believing even a fingle figh (Rom. viii. 26.) arifing trom fuch a fente of our infirmicies, and of the need we have of divine help, to be m ore acceptable to God, thin any perinrmances, however ipecious, which origir nate in the will of man.
"From what has been fuid refpesting worh:p, it fol1,ws, that the miniftry we approve mult have its origin from the hame fource: for that which is sicedtul fur a man's own directicn, and for has acceprance with Go.t (Jer. sxii:. 30, to 32.) whit be cminently fo to cable him to be helpful to others. Accoidingly, we beliene the renewed affilance of the light and power of Chrift to be indi penfably neceffiry fir all tue minilry ; and that his holy influence is not at our command, or to be procured by ftudy, but is the free git of Gol tw his choten and devoted frowats. - From hence atifes our le itim iny aglinit preaching for hire, an tin cuntradiction to Chrit's pofitive commant, "Freeiy ye have ree.ved, treely give;" ( \(\mathrm{M}_{\mathrm{at}}\) x. 8.) and hence our confrierti us refufal to fupport fuch minitery by tithes or other means
"As we dare not encourage any miniftry but that which we o.leve to frang from the infue ce of the Hoiy Spuit, fo neither dare watempt to reftain this inflience to perinns of any col dition in life, or to the male fex alone; bu, as male and female are one in Chrint, we ailow fuch of tise femsle fex as we believe to be ensued with a reght qualification for the miniAry, to exercife their gifts fur the general edification of the churcll: and this liberty we elleem to be a peculiar mark of the gofpel dipenlati n, as foretold by the proph t Joel ( J el ii. 28, 29.) and noticed by the apoitl.: Peter Avs ii. 16, 17):
"There are two ceremumes in ufe amongh moft profelfors of the Chriftian name; Water baptifm, and what is termed the Lord's Supper. The firth of thefe is generally elteemed the effertisil means of initiation in. to the church of Chrift; and the latter of maint ining communion with him. Bn: as we have been convinced, that nothing fiort of his redeening power, inwardly revealed, can tet the foul free from the thraddom of ti.1, by this power alune we believe falvation to be cf . fected. We hold that as th:re is one Lord and one fath (Eph. iv. 5.), fo his baptifm is one in nature and operation; that nothing faort of it can mabe us living members of his myttical body; and that the baptifns with water, adminitered by his fore-runner Joh, belonged, as the later confefled, to an inferior aud decreafing difpenation (John iii. 30).
"With refpest in the other rite, we believe that ermmunion between Chrift and his church is not maintaine.i by that nor any other external performance, bat only by a renl p.rticipution of his divine tature (2. Pet. i. 4.) through \(f\) with; that this is ile fupper alluded to in the Revelation (Rev. iii. 20.), "Behold I fand at the door aud knock, if any man hear my voice, and open the door, I will come in to hime, and will fup with hime, and ie with me," and that where the fulffance is attained, it is unneceflary to attend to the fhadow, which dorh in tomer grace, and conceming wheh opinions fo different, and animolities fo violent, ha e arifen.
"Now, as we thus believe that he grace of God, which comes by Jefus Cbrift, is alone fütiont for fal.

\section*{Q U A}

Quakers.
Quakers. vation, we can neitler admit that it is conferred on a few only, whilt others are left without it; nor, thus afferting its univerfality, can we limit its operation to a partial cleanfing of the foul from fin, even in this life. We entertain worthier notions both of the power and goodnefs of our heavenly Father, and believe that he doth vouchfafe to affit the obedient to cxperience a total furrender of the natural will to the guidance of his pure unerring Spirit ; through whofe renewed affifance they are enabled to bring forth fruits unto holinefs, and to ftand perfect in their prefent rank (Mat. v. 48.; Eph. iv. 13. ; Cul. iv. נ2.)
"There are not many of our tenets more generally known than our teltimony againg oaths and againlt war. With refpect to the former of thefe, we abide literally by Chrilt's pofitive injunction, delivered in his
* Sce Oath fermon on the mount, "Swearnot at all" (Mat.v. 34)". From the fame facred collection of the molt excellent precepts of moral and religious duty, from the example of our Lord himfelf (Mat. ch. v. 39,44 , \&c. ch. xxvi. 52, 53.; Luke xxii. 51.; John xviii. I1.), and from the correlpondent convictions of his Spisit in our hearts, we are confirmed in the belief that wars and fightings are, in their origin and cffects, utterly repugnant to the Gofpel, which ftill breathes peace and good-will to men. We a'fo are clearly of the judgment, that if the benevolence of the Gofpel were generally prevalent in the minds of men, it would effectually prevent then from opplefling, mach more from enflaving, their brethren, (of whatever colour or complexion), for whom, as for themfelves, Cirift died ; and would even infuence their conduet in their treatment of the bute creation, which would no longer groan the vitims of their avarice, and of their falfe ideas of pleafure.
- Some of our tenets have in former times, as liath been fhown, fubjected our friends to much fuffering from government, though to the falutary purpofes of government our principles are a fecurity. They inculcate fubmilion to the laws in all cafes wherein confcience is not violated. But we hold, that as Chrift's kingdom is not of this world, it is not the bufmefs of the civil magiftrate to interfere in matters of religion; but to maintain the external peace and good order of the community. We therefore think perfecution, even in the fmalleft degree, unwarrantable. We are cateful in requiring our members not to be concorned in illicit trade, nor in any manner to defraud the revenue.
" It is well known that the fociety, from its firf appoitance, has difuid thofe names of the months and days which, having been given in honour of the heroes or falle gods of the heathens, originated in their flattery or lapealation; and the cutom of fpeaking to a fingle perton in the plural number ( E ), as laving arifen alfo fron motives of adulation. Compliments, fupertuity of apparel and furniture, outword hows of rejoicing and mourning, and oblervation of days and fimes, we cheen to be incompatible with the fimplicity and fincerity of a Chriftian life ; and public diverfions, gaming, and ot'ser vain imutements of the world, we canmot but condemn. They are a walte of that time
which is given us for nobler purpofes, and divert the attention of the mind from the fober duties of life, and from the reproofs of inftruction, by which we are guided to an ceerlaiting inheritance.
"To conclude, although we have exlibited the feveral tenets which difinguifh our religious fociety, as objects of our belief, yet we are fenfible that a true and living faith is not produced in the mind of man by his own effort ; but is the free gift of God (Eph. ii. 8.) in Chrit Jefus, nourithed and increafed by the progret. five operation of his fpirit in our hearts, and our proportionate obedience (John vii. 17.) Therefore, although, for the preferration of the teltimeries given us to bear, and for the peace and good order of the fociety, we deem it necellary that thofe who are admitted into memberthip with us, flould be previoufly convinced of thofe doctrines which we efteem effential; yet we require no formal fubfcription to any articles, either as the condition of memberhip, or to qualify for the fervice of the clurch. We prefer the judging of men by their fruits, in a dependence on the aid of Him who, by his prophet, hath promifed to be "a fpirit of judgment to him that fitteth in judgment" (Itaiah xxviii. 6.) Without this, there is a danger of receiving numbers into outward communion, without any addition to that fpiritual fheeptold, whercof our bleffed Lord declared himbelf to be both the door and the fhepherd (John x. 7, II.) that is, fuch as know his voice, and follow him in the paths of obedience."

Sucl are the doctrines of this people as we find then Etated in a fimall pamphlet lately prefented by themfelves to the public; and in the fame tract they give the following account of their difcipline.
"In the prattice of difcipline, we think it indifpenfable that the order recommended by Chrift himfelf be invariably obferved: (Mathl. x viii. 15. to I7:) 'If thy brother thall trefpafs againtt thee, go and tell him his fault between thee and him alone: if he fhall hear thee, thou haft gained thy brother; but if he will not hear thee, then take with thee one or two more, that in the mouth of two or three witneffes every word may be eftablithed; and if he thall neglest to hear them, tell it unto the church.'
"To effect the falutary purpofes of difcipline, meetings were appointed, at an early period of the fociety, which, from the times of their being held, were called quartealy-meetings. It was afterwards found expedient to divide the diftricts of thofe meetings, and to meet more often ; whence arofe monthly-meetings, fubordinate to thofe held quarterly. At length, in 1669, a yearly-meeting was eitablifhed, to fuperimend, afilt, and provide, rules for the whole; previous to which, general meetings had been occafonally held.
"A monthly-meeting is ufually compcted of feveral particular congregations, lituated withia a convenient diftance of each other. Its bulinefs is to provide for the fublitence of their poor, and for the cducation of their offspring; to judge of the dincerity aul finnefs of perfons appearing to be convinced of the religious principies of the fociety, and during to be adnixted in:0
(e) Speaking of this cuftom, Fox fays: "When the Lord fent me into the world, he forbad mo to put off m hat to any ; and I was requited to thee and thou all men and women." Youm, \%., p. \({ }^{2} 4\).
into memberfhip; to excite due attontion to the dif-
charge of roligous and moral duty; and to doal with diforderly merthers. Monthly-meetings alfo grant to fuch of their members as remove into other now thly meetings, centificates of their memberthip and condust; without which they cannot gran memberthip in fuch mectings. Each montly-meeting is required to apprint certain perfons under the name of everfers, who are to take care that the rules of our difeipline be prut in prastice; and when any cafe of complaint or diforderly condact comes to their knowledge, to fee that pivate admonition, agreeable to the gofyel rule belorementioned, he given previous to its being laid before the monthly-meeting.
"When a cafe is introduced, it is ufual for a fmall committee to be appointed to vifit the offender, to chdeavour to convince him of his error, and to induce him to forfake and condemn it. If they fueceed, the perfon is by minute declared to have made fatisfastion for the offence; if not, he is difowned as a member of the fociety.
"In difpates between individuals, it has long been the decided judgement of the fociety that its members fhould not fue euch other at law. It therefore enjoins all to end their differences by fpeedy and impartial arbitration, agreeable to rules laid down. If any refufe to adopt this mode, or, having adopted it, to fubmit to the award, it is the direction of the yearly-meeting that fuch be difowned.
"To monthly-mectings alfo belongs the allowing of marrianes; for our focicty hath always fcrupled to acknowledge the exclufive authority of the priefs in the folemnization of marriage. Thofe who intend to marrs, appear cogether and propofe their intention to the munthly meeting; and if not attended by their parents or gundians, produce a written certificate of their confent, figned in the prefence of witncfles. The mecting then appoints a comnittee to enquire whether they are clear of other engagements refpeating matriage; and if at a fubfequent meeting to which the parties alfo come and declare the continuance of their intention, no objections are reported, they have the meeting's confent to folemnize their iatended marriage. This is done in a public meeting, for worthip; towards the clofe whereof the parties ftand up, and folemnly tale each other for hubband and wife. A certificate of the proceeding is then publicly read, and figned by the paries, and afterwards by the relations and others as witnefles. Of fuch certificates the monthly-meeting keeps a record; as alfo of the births and burials of its mombers. A certifizate of the date, of the name of the infant, and of its parents, figned by thofe prefent at the birth, is the fubject of noe of thefe lalt-mentioned records; and an onder for the interment, comnterigned by the oravemaker, of the other. The naming of chillere is without ceremony. Earials are Vol. XV .
aroconduged in a fomplemarner. The bue; follow
 to interment, caried to a meceing ; and at: the whe a patie is generally made; on beth which oecenons it fiequently lalls out that one or more frents preist have lomewhat to exprets for the edificati a of thole who atend ; but ins religious rite is conlidered as att clential pat of burial.
" Several morthly-nectings compore a quatter!; mecting. At the quatituly mecting are produced witten anfwers frem the monthly-mectings, to certain qu?ries reppectiegthe conduct of their members, and the neeting's eare over them. The accounts thus received are digeited into one, which is fent, alfo in the form of anfiwers to gueries, by reprefentatives, to the yearlymeeting. - Appeals from the judgement of monthiymeetings are brought to the quarterly-meetings; whole bulinefs alfo it is to athif in any diffecult cafe, or where remillnefs appears in the care of the monthly-nicetinge over the individuals who compore tham.
"The yearly-meeting has the gencral fuperintenclance of the fociety in the country in which it is eftablifhed (c); and therefore, as the aceounts which it receives divcover the ftate of inferior meetings, as particular exigencies require, or as the mecting is imprefied with at fenfe of duty, it gives futh iss advice, mates fucla regulations as appear to be requifise, or excites to the objervance of thole already made; and fometimes appoints committees to vilit thofe quatterly-mectings, which appear to be in need of immediate help. A/2 peals from the judgement of quarterly-mectings ars here finally determined; and a brotherly cortefpordence, by cpiftles, is maintained with other yearly. meetings.
"In this place it is proper to add, that its we heliere women may be rightly called to the work of the miniftry, we alio think, that to them belongs a fhare in the fupport of our Cbriflian difcipline; and that fome parts of it, wherein their own fex is concerned, devolve rn them with peculiar propriety. Accordingly they have monthly, quarterly, and yearly-mectings of their own fex, held at the fame time and in the fime place witin thofe of the nen: but feparately, and without the power of making rules : and it ray be remarked, that during the perfecutions, which in the laft contury occiafioned the inprifonment of fo many of the men, the care of tbe poor often fall on the women, and was by them fati-factorily adminillered.
"In order that thote who are in the lituation of minifers nay have the tender fympathy and counfel ot thofe of either fex, who, hy their experience in the work of religion, are qualified for that fervice ; the monthly-meeting are advife. 1 to feleat fuch, under the denomination of elfors. 'Ihefe, and miniters approvad by their monthly-meetings ( n ), have meetings pecuiar to themf.lves, cathed mectings of mimilters and elders; 5 A

\section*{QU A}
euker. in which hey have an opportunity of exciting each other to a difcharge of their feveral duties, and of extending advice to thole who may appear weak, withont any need!ef's expolure. Thefe meetings are generaily hedd in the compars of each monthly, quarterly, and \(y\) ently-meeting. They are conducted by rules preficribed by the yearly-meeting, and have no authority to make any alteration or addition to then. The membees of them unite with their brechren in the meetings jor dificipline, and are equally accountable to the latter for their condact.
"It is to a meeting of this kind held in London, called the fecond-day morning-meeting, that the revifal of manufcripts concerning our principles, previoully to publication, is intrufted by the yearly-meeting held in London ; ard ato the granting, in the intervals of the yearly-meeting, certificates ( \(f\) approbation to fuch minilters as are concerned to travel in the work of the minilly in foreign parts. When a vifit of this kind doth not extend beyond Great Britain, a certificate from the monthly-meeting of which the minifter is a member is fufficient; if to Ireland, the concurrence of the quarterly.meeting is alfo required. Regulations of fimilar tendency obtain in other yearlymestings.
"The yearly-meeting held in London, in the year 1675 , appointed a meeting to be held in that city, for the purpofe of advifing and affiting in cafes of fuffering for confcience fake, which hath continued with great ufe to the fociety to this day. It is compofed of friends under the name of correfpondents, chofen by the feveral quatterly-meetings, and who refide in or near the city. The fame meetings alfo appoint members of their own in the country as correfpondents, who are to join their brethren in London on emergency. The names of all thefe correfpondents, previous to their being recorded as fuch, are fubmitted to the approbation of the yearly-meeting. Thofe of the men who are approved minilters are allo members of this meeting, which is called the meeting for fufferings; a name arifing from its original purpofe, which is not yet become entirely obfelete.
"The yearly-meeting has intrufted the meeting for fufferings with the care of printing and difributing books, and with the management of its Itock; and confidered as a ftanding committee of the yearlymectinar, it hath a general care of whatever may arife, during the intervals of the meeting, affecting the focisty, and requiring immediate attention: particularly of thote circumptances which may occafion an applica. tion to government.
"There is not in any of the meetings which have been mentioned any prefident, as we believe that Divine Wudorn alone ought to prefide; nor hath any memter a right to claim pre-eminence over the relt. The ofice of clerk, with a few exceptions, is undertaken voluntarily by fome member; as is alfo the keeping of the records. Where thefe are very voluminous, and require a houfe for their depofite (as is the cafe in London, where the general records of the fociety in Great Britain are kept), a clerk is hired to have the care of them; but except a few clerks of this kind, and perfons who have the care of meeting-houfes, none receive any flipend or gratuity for their fervices in our religions fociety."

It is romarkable, that all the fettlements of the Ettropeans in Amenica, except the Quaker fettlement of Pennfylvania, were made by force of arms, with very lit. tle regard to any prior title in the natives. The lings of Spain, Portngal, France, and Britain, together with the States of Holland; then the only maritime powers, gave grants of fuch parts of America as their people could lay hold on, Itudying only to avoid interterence with their European neighbours. But Mr Penn, being a Quaker, did not think his power from King Cha. II. a futficient title to the country fince called Pennfyiania: He therefore affembled the fachems or princes then in that country, and purchafed from them the exient of land that he wanted. The government of this province was long in the hands of the quakers, who never have any quarrels with the natives. When they defired to extend their fettlements, they purchafed new lands of the fachems, never taking any thing from them by force. How unlike is this conduet to that of the Spaniards, who murdered millions of the natives of Aexico, Terra Firma, Peru, Chili, \&ic.

QUALITY is a word which, as ufed in philofophi. cal difquifitions, cannot be exphined by any periphralis. That which is exprefled by it mufi be brought into the immediate view of the fenfes or inteliect, and the name properly applied, or he who is a ftranger to the word will never be made to comprehend its meaning. Arifotle, who treated it as a general conception fecond in order among the ten predicanntrts or categrories (fiee CaTEGORY), gives feveral charaters of it; but though they are all in fome refpects jult, no man could from them, without other affifance, learn what quality is. Thus he

When a man comprehends, by means of his fenfes and intellect, what it is which the word quality denotes, he will indeed perceive that the firft of thefe characters is applicable to fome qualities and not to others; that the fecond is more applicable to quantity than to quality ; and that it is only the third which can with propriety be confidered as the general characteriftic of this predicament. Thus when we have learned by our fenfe of fight that rubitenefs is a quality of fnow, and blacknefs of coal; and by means of obfervation and reflection, that wiftom is a quality of one man and folly of another-we mult admit that the fenfible quality of the fnow is cortrary to that of the coal, and the intellectual quality of wifdom contrary to that of folly. There is, however, no contrariety between wiflom and wobitenefs or black\(n \approx f_{s}\), nor between bardinefs or fofinefs, and any particular colour; for fenfible and intellectual qualities can never be compared; and it is not eafy, if polfible, to make a comparifon betureen qualities perceptible only by different fenfes: Nay, among qualities perceptible by the fame fenfe, we often meet with a difference where there is no contrariety; for though the figure of a cube is different from that of a /plere, and the figure of a Square from that of a circle, the fphere is not contrary to the cabe, nor the circle to the fquare.

His fecond characteriltic of this genns is fill lefs proper than the firlt. It is indeed true that fome qualities admit of intenfion and remifion; for fnow is whiter than paper, and one woman is handfomer than another; but

\section*{QU A [ 739 ] QU A}

2

Ariftotle has other fecculations refpesting quality, which are worthy of notice. He diftinguifhes between qualities which are effential and thofe which are acciden. ral; between qualities which are natural and thofe which are acquired; and he fpeaks of the qualities of capacity and thofe of completion. Exterfion and figure in general are qualities effential to all bodies; but a particular extenfion, fuch as an inch or an cll, and a particular figure, fuch as a cube or a /phere, are qualites accidental to bodies. Among the natura! qualities of glafs it is one to tranfmit objects of vifion; but to enlarge thefe objects is an adventitious or acquired quality. The same quality may be natural in one fubltance, as attraction in the magnet; and acquired in another, as the fame a:traction in the magnetic bar. Docility may be called a quality natural to the mind of man, fcience an acquired one. To underfland what he means by qualities of capacity and completion, it may be fufficient to obferve that every piece of ion las the qualities of a razor in capacity, becaufe it may be converted into ftcel, and formed into a razor : when it is fo formed, it has, in the language of this fage, the quality of a razor in completion. Among the qualities of capacity and completion, the mof important, and what may lead to interefting, fpeculations, is the reaioning faculty of man. A rapacity of reafoning is elfential to the human mind; but the completion of this capacity or actual reafoning is not, otherwife infants and perfons aflecp would be exchuded from the human fpecies.
of the fpecics of quality called figure we carnet predicate either more or lifs. A crown-piece may have as much of the circular quality in it as the plane of the equator, and a mufket-bullet as much of the fpherical quaity as the orb of the fun. It is indeed a property of all gzantily to adnuit of intenfion and remilfion; and thetetore this ought to have been given as the charicter not of the fecond but of the third caterory. See Quantity.

That it is only from a comparifon of their qualities that llings are denominated like or unlike or that one thing cannot refonble awotler lut in fome quality, is indeed a jult obfervation. We know nothing directly but qualities fenfible and intellectual (fee Metaphrsics, \(n^{\circ}{ }^{1} 49\), 150, 151, and 227) ; and as thefe have no refemblance to each other, we conclude that body or matter, the fubject of the formet, is a being unlike mind, the fubject of the latter. Even of bodies themfelves we can fiay, that one is like or unlike another only by virtue of their qualities. A ball of ivory refembles a ball of fnow in its figure and colour, but not in its coldnefs or bardrefs; a ball of lead may refemble a ball of fnow in its figure and colatnefs, but not in its colour; and a cube of ivory refembles not a ball of lead either in figure, colour, or coldn:fs. Thee mind of a brute refembles that of a man in its powers of fenfation and porepsion, but does not refemble it in the powers of volition and reafoning; or at leaft, the refemblance, in this latter inftance, is very night. All bodies refemble one another in being folid and extended, and all minds in being more or lefs active. Likenefs or unlikenefs therefore is the univerlal characteriftic of the category quality.

Mr Locke has puzzled his readers, and perhaps himfelf, with a queflion refpeding the fpecies of an idiot or changeling, whom he pronounces to be fomething between a man and brute*. It is not often that we
feel ontrelwes inelised to regret Loche's ignotance of Arillote's difinetions; but we cannot help thinkine, that had the Britifh philotopher attended to the Stagy. tite's accomnt of gualities in capaciey and qualitios in completion, this perplexing guellion would neve: have been Rarted. It is jufly obenved in the Eifirg; on \(/ / u\) man Uotlerflatidisig, that of real ofenees we linow nothing: but that every man felects a certain number of qualities whicls he has always perccived united in certain beings ; and forming thefe into one complex conception, gives to this conception a fpecifie name, which l.e applies to every being in which he finds thole qualities united. This is undoubtedly the procefo of the mind in Strange forming gerera and fpecies; and as the excelient author criferefufes the name of man to the clangeling, it is cbvious quence of that the complex conception, to which he gives that this over name, onult imply rationality or the adual cxerifie of rea- figh. fon. But this limitation will exclude many beings from the fpecies man, whom Mr Locke certainly conlidered as men and women. Not to mention infatits and perfons in found fleep, how thall we, clats thofe who, after having lired 30 or 40 years in the full exercife of reafon, have been fuddenly or by degrees deprived of it by fome diforder in the brain?
From Marlb'rough's eyes the Itreams of dotage fow ; And Swift expires a driveller and athow.

\section*{Jonsson.}

But were the hero and whe wit in thofe deplorable circumfances excluded from the human fpecies, and clalled between men and brutes? No furely; they were both acknowledged to be men, becaule they were known to have the quality of reaton in what Ariftote would have ealled capacity. Their dotage and drivelling originated from fome diforder in their bodies, probably in the region of the brain; and Locke himfelf contends that no defect in body is fufficient to degrade a perfon from the rank of manhood. Again, lunatics have the exercife of reafon, except at new and full moon. Are thefe unhappy beings fometimes men and fometimes a fpecies by themfelves between men and brutes?

It appears, therefore, that not the afiual exercife of Fallacy of reafon, but reafon in capacity, ought to be included in his docthe complex conception to which we give the fpecilic name of man, as fome of the greatelt men that ever lived have been during pats of their lives deprived of the power of aflual reafoning. This, however, it will be daid, does not remove the difficulty; for the occafional exercife of reafon in lunatics, and the great exertions of it in fuch men as Swift and Marlborough, thow that they had it in capacily at all times; whereas we have no evidence that changelings have even at capaciy of reafoning at any time, fince they never do a rational action, nor ever utter a ientence to the puppe. That we have no direa and pofitive cvidence of the minds of change. lings being capable of reafoning, were they fupplied with proper organs, mutt be granted ; but the probabilities of their being fo are many and great. We know by experience that the actual cxercife of reafon may be interrepted by an occational and accidental preffure on the brain: and therefore we cannot doubt but that if this prellure were rendered permanent by any wrong configuration of the kull given to it, in the womb, or in the act of being born into the world, an infant, with a mind capable of reafoning by means of proper organs,

\section*{rine re-} fpecting the hunian fuecicos

\section*{QUA 「 740}

Qainty would by this accident be rendered, though the whole of hife, an idiot or changeines. That idiotimn is catued by luch accidents, and is not the quality of an inferior mind occalionally given to a hamm body, will at leaft leam probable from the following conliderations.
True ductrine.

It does not appear that an animal body can live and move but while it is attuated by fome mind. Whence
tien does the unborn infant derive its mind? It muft be either immediately from God, or ce traduce from its parents ; but if the inind of man be immaterial, it callnot be ex fraduce. Now, as idiots are very few in num. bor when comparel with the rational part of the human dipecies, and as God in the government of this world acts not by partial but by geneallaws ; we muft conclade that the law which he hat eftablifhed refpectince the union of mind and matter, is, that human bodies Ahall be animated with minds endowed with a capacity of reafoning, and that thofe who never excit this capasity are prevented by fome fuch accident as we have alligned.

For a further account of qualities, why they are fup. pofed to inhere in fume fubject, togrether with the ufual ditintion between the pimary and fecondary qualities of matter, fee Metaphysics, Part II. Chap, I.

Chemical Seatitafs, thole qualities principally introsluced by means of elsemical experiments, as fumigation, amalgamation, cupellation, volatilization, precipitation, \&c.

Quabity, is alfo ufed for a kind of title given to ecrtain perfons, in regard of their territories, figniories, or other pretenfions.

QUAN =A. Sice Capra.
@UANG-ping-rol, a city in China, is fituated in the northern part it the province of Pe-tcheli, between the provinces of Chang-tong and Ho-nan, and has nine citie, of the third clafs dependent on it; all its plains a:e well watered by rivers. Amony its temples, there \(i\) is one dedicated to thofe men whe, as the Chinefe pretend, difeovered the fecret of rendering themfelves immortal.

QUAlvGSI, a province of Chinai, bounded on the worth by Koe-l'cheau ard Hu-Qnang ; on the eall, by Irman and Quantong; on the fouth, by the fame and 'Ton-guin ; and on the wett, by Ym-nan. It produces fireat plenty of rice, being watered by feveral large rivers. The fouthern part is a fat country, and well cullisated; but the norileen is full of mountains covered with trees. It contains mines of all forts; and there is a gold-mine lately opened. The capital town is Quic-ling

A very fingular tree, fiyg Grofier, grows in this provinces inflead of pith, is contains a fuft pulp, which gislds a kind of Hour: the bread made of it is faid to he exccedingly good. Defides parnquets, hedgehogs, percupines, and rhinecerofes, a prodigious number of wild :minals, curious birds, and uncommon inficte, are found here.

This province contains 12 villages of the firt clafs, anel 8o.f the fecond and thind.

QUANE-Tong, a province of China, bounded on t'ue ett by Kiang-fi and Fukien; on the fouth, by the ocean; and on the welt, by 'fonquin. This province is diveriand by vaileys and mountains; and yie!ds two eroes of corn in a year. It abounds ingeld, Jewels, filk, featls, tin, quickfilver, fugar, brafs, iron, Itcel, fali-
petre, ehony, and feveral iorts of odoriferous wood; belides fruits of all forts proper to the climate. They have a prodigious number of duck, whole eggs they hatch in ovens; and a tree, whofe wood is remarkably hard and heavy, and thence called iron-rwood. The mountains are covered with a fort of ofiers which creep ablong the ground, and of which they make bakets, hurdles, matts, and ropes.

Although the climate of this proviace is warm, the air is pure, and the people are robult and healthy. They are very induftrious; and it muft be allowed that they poffers in an eminent degres the talent of imitation : if they are only fhown any of the European works, they erecute others like them with the mof furprifing exacinefs. This province fuffered much dusine the civil wars; but at prefent it is one of the moft flourithing in the empire; and, as it is at a great diftance from court, its government is one of the molt important. This province is divided into ten diftricts, which contain to cities of the firft clafs, and \(S_{f}\) of the fecond and third. Canton is the capital town.

QUAN1'ITY, as explained by the great Englith lexicographer, is that property of any thing wheh may be increafed or diminifhed. This interpretation of the ward is certainly jut, and for the purpofes of common converfation it is fufticiently determinate; but the man of fcience may expect to find in a work like ours a definition of the thing fignified. This, however, cannot be given him. A logical definition confifts of the ginus under which the thing defined is ranked, and the Specific difference (fee Logic, \(n^{\circ}=0\), Exc.) ; hut quantity is ranked under no genus. In that fchool where fiach definitions were moft valued, it was confidered as one of the ten categories, or general conceptions, under which all the objects of hum an apprehenfion were muftered, like foldiers in an army (fee Category and Philosophr, \(n^{\circ}\) 22.) On this account, even Ariftotic himielf, who delighted in defintions, and was not ealily deterred from a davourite purfuit, could not confiftently with his own rules attempt to define quantity. He Charaiccharacterized it, however, in feveral parts of his works; rized by and particularly in the is th chapter of the 4 th book of Arifutle. his metaphylice, where he gives the following account

 the fame, of which the substance is one: finilis, of which the QUALITY is one; equal, of which the QUAN. rity is one. Again, lie tells us** that the chief characteriftic of quantity is, that it may be denominated equal and unequal.

That any man can become wifer by reading fuch deforiptions as thefe, none but an idolater of Arifotle will fuppofe. There is, indeed, no periphrafis by which we can explain what is meant by quantity to thofe wh. have not previoully formed fuch a notion. All that can be done by making the attempt is only to fettle language, by fating exactly the cafes in which we ufe this word in the greateft conformity to general cultom; for there is a laxnefs or carelefsnefs of expreffion iu the langrage of moft men, and nur notions are frequently communicated by fpeech in a way by no means precife; fo that it is often a great chance that the notions excited in the mind of the hearer are not exal counterparts of thofe in the mind of the fpeaker.

\section*{QUA [ 741] QU A}

The mandernandings of men difier in ronling mone remarhably than in their power at :bll madifar, and of rapidly foming concepticnis fo ecercrab and fimple as not to be clonged with cillinguilhing circunfances, Which may be ufferent in difier ni minds while uttoring and hearing the lume words: and it is of great ennie. quence to a man of ficentific habits, eidher to cultivate, if peffible, this taler.t, or to fuperfede its ufe, by thudioufly foming to himferf wations of the mof inpentant uniterfis in his own cource of contemplation, by carcful ablhaction of crely thing extrancons. His langratge by this me:us becomes donbly infradive by its extreme !recilion; and lew will even judge with ercater cortainty of notions intended to be communicated by the more flovenly language of another perton.

Whe c:mnct f.ly that there is much ambiguity in the gencral we of the term quantity: But herc, as in all other cafes, a love of refinement, of novelty, and frequently of varity, and the wilh of appeating ingenions and original, have made men take advantage of even the imill latitule with which the carelef's ufe of the word will furnih them, to ampee themelves and the public by giving the appearance of fience to empty founds.

Mathematics is undoubtedly employed in diforering and Aating many relations of quimity; and it is in this category alone that any thing is conicmplated by the matheniatician, whether in geometry, arithmetic, or allgebra. Hence mathematics has bcea culled the fricnce of quantity. The fimplicity of the object of the mathematician's con'emplation, and the unparalleled diftinctnefs with which he can perceive its modifications, have cnabled him to eres a body of fcence, eminent not only fir iss cettainty, but alfo for the great length to which he can cary his teatorings withont danger of error; and the intimate comection which this feienec has with the arts of life, and the important fervices which it has periormed, have procured it a moll refipest able place in the ciucle of the feimes. Ingenious men lave availed themfelves of this pre-eminence of mathematies, and have endeavonred to procure refpeet for their difquifticns on ouher fubjeets, by frefenting them to the public as branches of mithematical fcience, and theselore fufceptibe of that aceuracy and certainty which arc its peculiar boaft. Our meral affesions, nur funftio: s, nur intellesual powers, are all futfectible of angmentation and dinimutim, are conccivable as greater and lefs when thated thenether, and are familiarly 'tpoten of as admitting of degrees of compuifon. We are perfenty will underfood when we fiy that one pain, hic.at, grief, kinduefs, is gicater than ancther; and as this is the diftirguibing charatcritlic of quantity, and as quantery is the fuljeet of mathematic:l chicuffon, we fuppofe that thefe fubjects may be treated mathematically. Accordingly, a very celebra:cd and excellent philofopher* las faid, among many things of the fame
lind, that the greaticefs of a favour is in the direa Quan \({ }^{\circ} \mathrm{y}\). conturund atio of the fervice peafomed ard the dignity ol the performer, and the invelde ratie of the merit and tank of the seceiver; that the valu: of it chat taftr is in the componad ration of the talemes and vistur, \&e.; and J.e las delivered a number of Icmat propo. fitions on the mon interefing quaftons is: morals, couched in this mathematical langenge, and eran cxpeefed by algebaic fummax. Jut this is mere play, and conveys s:o inftrution. We underfatad the words; they contatn no ablirdity; and in as far as they lanc a fenfe, we bel crethe propoftions io be tutc. Lut hey give no greater precifon to our fomiments than the more ufual expretlions would do. If we atterad clofly to the meaning of any one of fuch propolitions, we lhall fund that it only exprefles fome vague and indtat ind notions of degres of thofe emotims, fentiments, or quallitics, which would be jult as well conceived by moans of the exprefions of ordinary laneuage ; and that it is only by a foat of analogy or refombiance that this mathematical language conveys any notions whatever of the fubjects.

The objest of contemplation to the mathematician is The manot whatever is fufceptible of greater and lefs, but what thematiis meaturable; and mathematics is not the ference of cian conmagnitude, in its moft abftracted and general acceptation, but of magritude which can be meafured. It is, indced, the science of measure, and whatever is mes that indce, the science of mensure, and whatever is are mẹatreated in the way of menfuration is treated mathema. furable. tically. Now, in the difeourfe of ordinary life and ordinary men, many things are called quantities which we cannot or do not meature. This is the eafe in the infances already given of the affections of the mind, pleafure, pain, beauty, wifdom, honour, \&c. We do not lay that they are incapable of meafure; but we have not yet been able to meafure them, nor do we think of meafining them when we fpeak rationally and ufefully about them. We therefore do not confider them mathematica!ly ; nor can we introduce mathematical precilion into ous difeufions of thefe fubjects till we can, an 1 aftually do, meafure them. Perfons who are precile in their expreffion will even avoid fuch phrafes on theie fubjeats as fuppofe, or ftriclly exprefs, fuch menfarement. We fhould be much embarraffed haw to anfiwer the gucflion, How much pain dnes the toothache give you jatl now ; and how much is it eafier lince ycticrday? Yet the antiver (if we had a meafure) would be as ealy as to the quellion, How many guineas. did you win at cards? or how much lamd have you bought? Nay, though we fay familiarly, "I hnow well how much fuch a misfortune would affect you," and are underftood when we fay it, it wond be aukward language to fay, " I know well the quantity of y " ur griel." It is in vain, therefore, to eaper mathematic:: 1 precifion in our difcourle or conceptions of quantities in the moft abletracted f.nle. Such preciifon is confincd to quantity which may be and is meafured (a). It is only trilling
(a) To talk intelligibly of the quantity of a pin, we fhould lave fome fandard by which to meature it; fome known cegree of it fo 'well afcertansed, that all men, "hen talking of it, thould me:n the fame thing.And we flould be able to compare other degrees of pain with this, fo as to perceive dittinctly, wot only whether they exceed or foll hort of it, but allo how much, or in what propetion; whether by ar haif, or a fith, 6 or a tenth. Reill.

\section*{OUA}
\(\underbrace{\text { Qurnogy }}\)

6
Meffuring explained. trifling with the imagination when we employ mathematical language on fubjects which have not this preperty. It will therefore be of fome fervice in fcience to difcimbate guantities in this view; to point out what are furceptible of meafure, and what are not.
What is menfuring? It is one of thele two things: It is either finding oue fome hown magnitude of the thing meafured, which we can demonftrate to be equal to it ; or to find a known magnitude of it, which being taken fo many times fhall be cqual to it. The geometer meafures the contents of a parabolic fpace when he exlibits a parallelogram of krown dimentions, and demonflrates that his parellogram is equal to the parabolic fpace. In like manuer, he meatures the folid contents of an infinitely extended hyperbolic fpindle, when he exhibits a cnic of known dimenfions, and demonfrates that three of thefe concs are equal to the findle.

In this procefs it will be found that he actually fubdivides the quantity to be meafured into parts of which it conlifes, and fates thefe parts as actually making up the quantity, fpecifying each, and afligning its boundaries. He goes on with it, piece by piece, demon1hrating the refpeftive equalities as he goes along, till he has exhauted the figure, or confidcred all its parts.-

When he meafures by means of a fubmultiple, as when he fhows the furfice of a iphere to be equal to four of its great circles, he flops, after having demonftrated the equality of one of thefe circ!es to one part of the furfice: then he demonftrates that there are other three parts, each of which is precifely equal to the one he has minutely confidered. In this part of the procefs he exprefsly afigns the whole furface into its diftinct po:tions, of which he demontrates the equality.

But there is another kind of geometrical meafurement which proceeds on a very different principle. The geometer conceives a certain individual portion of his figure, whether line, angle, furface, or folid, as known in refpeet to its dimenfions. He conceives this to be lifted fiom its place, and again laid down on the act, oming part of the figure, and that it is cqual to the part which it now covers; and therefore that this part together with the firft is double of the firf: he lifts it again, and lays it down on the next adjoining part, and affirms that this, added to the two former, make up a quantity triple of the firft. He goes on in this way, making fimilar inferences, till he can demonftrate that he has in this manner covered the whole figure by twenty applications, and that his moveable figure will cover no more; and he aflirms that the figure is twenty times the part employed.

This mode is precifely fimilar to the manner of practical meafurement in common life : we apply a foot-rule fuccefively to two lines, and find that 30 applications exlaant the one, while it requites 35 to exliauft the

Euch \({ }^{\prime}\) 's funth pro rofition. other. We fay, therefore, that the one line is 30 and the other 35 feet long ; and that thefe two lines are to each other in the ratio of 30 to 35 . Having meafured two fhorter lines by a fimilar application of a flick of an inch long 30 times to the ore and 35 times to the other, we fay that the ratio of the two firft lines is the fame with that of the two laft. Euclid has taken this method of demonftrating the fourth propofition of the firlt book of his celebrated elements.

But all this procefs is a fection of the mind, and it is the fiction of an impolibility. It is even inconceivalle,
that is, we camot in imagination make this application of one figure to another ; and we prefume to fay, that, if the elements of weometry camot be demonftrated in fome other way, the fcicnce has not that title to pure, abftract, and intallible knowledge, which is ufually allowed it. We cannot fupto one of the triangles lifted and laid on the other, without fuppoling it fomething different from a triangle in abfradio. The individuality of fuch a triangle conlits folely in its being in the precife place where it is, and in occupjing that portion of fpace. If we could difinetly conceive otherwife, we fhould perceive that, when we have lifted the triangle from its place, and applied it to the other, is is gonc from its former place, and that there is no longer a triangle there. This is inconceivable, and fpace has always been acknowledged to be immoveable. There is therefore fome logical defect in Euclid's demonftration. We apprehend that he is labouring to demonltate, or rather illuftrate, a fimple apprehenfion. This indeed is the utmoft that can be dune in any demonftration (fee \(\mathrm{ME}_{\mathrm{E}}\) taphysirs, no 82.) : but the mode by which he guides the mind to the apprehenfion of the truth of his fourth propofition is not confiltent cither with pure mathematics or with the laws of corporeal nature. The real procefs, as laid down by him, feems to be this. We fuppofe fomething differsnt from the abfract triangle ; fome thing that, in conjunction with other properties has the property of being triangular, with certain dimenfions of two of its fides and the included angle. It has avowedly another property, not effential to, and not contained in , the abftract notion of a triangle, viz. mubility. We alfo fuppofe it permanent in fhape and dimenfions, or that althnugh, during its motion, it does not occupy the fame fpace, it continues and all its parts, to occupy an equal fruce. In thort, our conception is very mixed, and does not perceptibly differ from our conception of a triangular piecc of matter, where the triangle is not the fubject, but an adjunct, a quality. And when we fuppofe the arplication made, we are not in fact fuppofing two abfriet triangles to coincide. This we cannot do with any thing like difinctnefs; for our diftinet couception now is, not that of two triangles coinciding, but of one triangle being now exactly occupied by that moveable thisgr which formerly occupied the other. In fhot, it is a vulgar meafurement, reftricted by fuppofitions which are inadmiffible in all actual meafurements in the prefent univerfe, in which no moveable material thing is known to be permanent, either in Chape or margnitude.

This is an undeniable confequence of the prinsiple of miverfal gravitation, and the comprefibility of every kind of tangible matter with which we are acquainted. Remove the brafs rule but one inch from its place; its gravitation to the earth and to the ref of the univerfe is immediately changed, and its dimenfions chance of confequence. A change of tentperature will produce a fimilar effect ; and this is attended to and conlidered in all nice menfurations. We do the beft we can to affure ourfelves that our rule always occupies a fenfibly equal fpace; and we mult be concented with chances of error which we can neither perceive nor remove.

We might (were this a proper place) take notice of fome other logical defeets in the reaforing of this celebrated propofition: but they are befide our prefent purpofe of explaining the different mod:s of mathemati-
cal mafurement, with the view of difeoverinf that circumftance in which they all agtee, and wheh (if the only onc) nutt thercfore be the characterillic of menfutation.

We think that the only circlimftance in which all modes of menfuration agree, or the orly notion that is found in shem all, is, that the quintity is conccived as confifting of parts, difinguilhable from each other, and fep.urated by alignable buundarics ; fo that they are at once conecired feparately and jointly. We ventu:e to alert that no quanity is direaly menfured which we cannot conceive in this way, an 1 that fuch quantities only are the immediate cbjects of mathenatical contemplation, and foold be diftinguthed by a generic name. Let them be called Mathemaricai ruantities. Extension, Deration, Number, and Proportion, have this characteriftic, and they are the enly quantities which have it. Any perion will be convineed of the finf affertion by attending to lis own thonghts when contemplating the fe notions. Fe will find that he conceives every one of them as made up of its own parts, which are diftinguifhable from each other, and have afignable boundaries, and that it is only in conlequence of involving this conception that they can be added to or fubtracted from each other; that they can be multiplied, livided, and conccived in any proportion to each other.

He may perhaps find confiderable difficalty in acquiring perfectiy diftinct notions of the menfurability, and the accuracy of the modes of menfuration. He will find that the way in which he meafures duration is very limilar to that in which he meafures face or extention. He does not know, or does not attend to, any thing which hinders the brafs feot-rule in his hand from continuing to occupy equal faces during his ufe of it, in mealuring the diftance of two bodics. In like manner he felects an event which nature or art can repeat continually, and in which the circumftances which contribute to its accomplilhment are invariably the fame, or their variations and their effects are infenfible. He concludes that it will always occupy an equal portion of time for its accomplifhment, or always laft an equal time. Then, obferving that, during the event whofe duration he withes to meafure, this ftandard event is accomplifhed 29 : times, and that it is repeated \(365 \div\) times during the accomplifhment of another event, lie affirms that the durations of there are in the ratio of \(29:\) to \(365 \frac{1}{4}\). It is thus (and with the fame lugical defect as in the meafuricg a line by a brads rod) that the aftronomer meafures the celeftial revolutions by mieans of the rotation of the earth round its axis, or by the vibrations of a pendulum.

We are indebted for molt of the preceding obfervations to Dr Reid, the celebrated author of the Inquiry into the IIuman Mind on the Principles of Common Senfc, and of the Llfays on the intellectual and attive powers of Man. He has publifhed a differtation on this fubject in the \(45^{\text {th }}\) volume of the Philofophical Tranfadions, \(n^{0} 489\), which we recommend to our philnophical readers as a performance eminent for precilion and acutenefs. If we prefume to differ from him in any trivial circumfance, it is with that deference and re-
ber, the characters of mathematical quantity naly be Qumenv. reftricted to thefe three. He calls them Fpoper guan. titice, and all others he calls raproptr. We balicye that, in the utmof precifon of the Engrgith language, this denomination is very appofite, and that the word quantity, derived from quantum, always fupoles meafurment: but the word is frequently ufed in cafes other where its original is not kept in view, and we ufe other quantiees words as fynonymous with it, when ail menfuration, that ranmot whether pofible or not, is out of cur thoughts. Ac- beconidercording to practice, therefore, the jus at normat lugetsodi, matically. there feems to be no impropricty in giving this name, in our language at leaft, to whatever can be conceived as gatat or litile. 'There is no impropriets in faying that the pain occationed by the flone is greater than that of the tnothache ; and when we farch for the category to which the allertion may be referred, we cannot find any other than quantity: We may be allowed therefore to fiy, with almot all ficientific men, that every thing is conceivable is refpect of quantity which we can chink or fpeak of as greater and lefs; and that this notion is the charackeriftic of quantity as a genus, while meafurablencts is the characteriltic of mathematical quantity as a fpecies.

But do we not meafure many quatities, and confider them mathematically, which have not his characteriftic of being made up of their own diftinguilhable parts? What elfe is the employment of the mechanician, when fpeaking of velocities, forces, attraftions, repulfions, magnetic influence, chemical affinity, \&c. \&c.? Are not thefe mathematical fciences? And if the precifion and certainty of mathematics arife from the nature of their fpecific object, are not all the claims of the mechanician and phyfical aftronomer ill-founded pretenfiens? Thefe queftions require and deferve a ferious anfwer.

It is molt certain that we confider the notions which Velocity, are exprefied by thefe torms velocity, force, denfity, and force, de ththe like, as fufceptible of meafure, and we confider them fity, how mathematically.

Some of thefe terms are nothing but names for relations of meatirable quantity, and only require a little reflection to fhow themfelves fuch. Velocity is one of thefe. It is only a name exprefling a relation betwoen the face defcribed by a moving body and the time which elapfes during its defeription. Certain moderate rates of motion are familiar to us. What greatly exceeds this, fuch as the flight of a bird when compared with nur walking, excites our attention, and this excefs gets a name. A motion not fo rapid as we are familiar with, or as we wilh, alfo gets a name ; becaule in this the excefs or defed may intereft us. We wifn for the flight of the hawk; we chide the tardy pace of our melienger : but it is foientific curiofity which firt coniders this relation as a feparate object of contemplation, and the philofopher mutt have a name for it. He has not formed a new one, but makes ufe of a word of common language, whore natural mcaning is the combination of a great fpace with a thort time. Having once appropiated it, in his fcientific vocabul.ry, to this very general ufe, it lofes with him its true fignification. Tardity would have done juft as well, though its true meaning is diametrically oppolite ; and there is no greater impropriety in faying the tardity of a cannon bullet than in faying the velocity of the hour-hand of a watch.

Velocity

\section*{QU A}
\(\underbrace{\text { Quantity. }}\)
Velocity is a qualit or affection of motion, the notion of which includes the notions of fpace and duration (two ma:lematical quantitics), and no other. It does not therefore espref, a mathematical quantity icfelf, but at relation, a combination of iwo mathematical quantities of different hinds; and as it is meafumbic in the quantitios fo combined, its meafure mult be a unit of its own hind, that is, an unit of fpace as combined with an mit of tine.

Density is ancther word of the fame lind, expref. fing a combination of fpace with number. Denfie arbares means trees flanding at a fmall diftance from each other ; and the word is ufed in the fame fenfe when we fay that quickfilver is denfer than water. The expreflion always fuggefts to the reflecting mind the notions of particles and their diftances. We are indeed fo habituated th complicated vieus of things, that we can fee remote connections with afonithing rapidity; nnd a very few circumfances are fufficient for leading forward the mind in a train of inveftigation. Common ditcourfe is a mof wonclerfu! infance of this. It is in this way that we fay, that we found by weighing them that inflammable air had not the fixth part of the denfity of common air. Suppofing all matter to coufit of equal atoms equally heavy, and knowing that the weight of a bladder of air is the fum of the weights of all the atoms, and alro knowing that the vicinity of the atoms is in a certain propotion of the number contaned in a given bult, we affirm that common air is more than fix times denfer than inflammable air ; but this rapid decifion is entirely the effect of habit, which makes us familiar with certain groups of conceptions, and we inflantancoufly diitinguifh them from others, and thus think and difcourfe rationally. The Latin language employs the word frequens to exprefs both the combination of fpace and number, and that of time and mumber.

There are perhaps a fow more words which exprefs combinations of mathematical quantities of different kin's; and the correlponding ideas or notions are therefore proper and immediate fubjeets of mathematical dif. cuminn: But there are many words which are expreffive of thinge, or it leat of notions, to which this way of confidering them will not apply. All thofe affections or qualities of extermal bodies, by which they are conceived to at on each ohher, are of this kind: Impulshe ffrce, werght, centripetal and centrifugal torce, magnetical, electrical, chemical artractions and repulsions; in thert, all that we confider as the immediate caufes of natural phenomena. Thefe we fimiliarly ineafure, and confider mat thematically.
Forcesmafured in the phes, ome. n.а.

What was faid on this futject in the article Physics will give us clear conceptions of this procefs of the mind. Thefe forces or camies are not inmediate objects of contemphation, and are known only by and in the phenomena which we confider as their effects. The phenomenon is not only the indication of the agency of any caufe, and the churacieritic of its kind, but the meafure of its degres. The neceflary circumbtanes in luistrain of human thought are, 1 it, The notiun ot the force as fomelling fufeptible of angmertation and dimimtion. 2d, The motion of an infeparahic connétion of the force with the effecte prodied and of every defree of the one with a correfonding degree of the otiber. from thefe is formed the notion ihat the phemomenon
or effect is the proper meafure of the force or caufe. A! this is frialy lectical.

But when we are confidering there fubjects mathematically. the immediate cijents of our contemplation are not the furces which we are thus treating. It is not their relutinns which we pereeive, and which we combine with fuch complication of circumfances and certainty of inference as are unknown in a'l other ficinces: by no means; they are the phenomena onlyr, which are fubjects of purely mathematical difcultion. They are motions, which involve only the notions of fpace and time ; and when we have finifhed an accurate mathematical inveltigation, and make our aftirmation concerning the forces, we are certain of its truth, becaule we fupsore the forces to have the proportions and relations, and no other, which we nbferve in the pheno. mena. Thus, afier having deinonitrated, by the gevmetrical comparifon of the lines and angles and firrfaces of an cllipfe, that the momentary defleftion of the moon from the tangent of her orbit is the 3 footh part of the fimultimenus deflection of a tone from the tangent of its parabolic path, Newton affirms, that the force by which a particle of the monn is retained in her orbit is the 3 Gooth past of the weight of a particle of the ftone; and having father hown, from lat and obfervation, that thefe momentary deflections are inverfely as the fquares of the diftances from the centre of the earth, he affirms, that all this is produced by a force which varies its intenfity in this manner.

Now all this inveltigation proceeds on the two fuppofitions mentioned above, and the meafures of the forces are in fact the meafures of the phenomena. The whole of phylical aftronomy, and indeed the whole of mechanical philofopliy, might be taught and undesfood, without ever introducing the word force, or the notion which it is foppofed to exprefs: for our mathenatical reafonings are realiy about the phenomena, which are fubjects purely mathematical.

The precifion, therelore, that we prefume to affirm to attend thefe inveltigations, arifes entirely from the meafurable nature of the quantities which are the real objects of our contemplation, and the fuitableneís and propriety of the meafures which we adopt in our comparitons.

Since, then, the phenomena are the immediate fubjects of our difcuffion, and the operating powers are only inferences from the phenomena conlidered as effects, the quantity afcrived to them muft allo be an iuference from the quantity oi the effect, or of fome circumftance in the eifect. The meafure, therefore, of the caufe, or natural power or force, cannot be one of itsown parts ; for the whole and the pat are equally unperceived by us. Our incafure, the efore, mull be a meafiac of fome interefing part, of of the chly interelting part of the phenomenon. It is therefore in a manner abitrary, and depends chicfly on the intereft we take in the plenomenon. It muft, however, be fettled witla precifion, fo that all men in uling it may mean the fome thing. It muft he fettled, therefore, by the defeit tion of hat part or circumat ance of the phenomenon which is charatenitic of the natural power. This deforistion is the thta ion of the mealure.

\section*{QUA [ 745\(]\) QUA}
four times as high, againit the uniform adion of gravity ; that it penetrates four times as deep into al picce of miform clay; that it bends four times as many fprings, or a foring four times as ftrong, to the fume degree; and produces a great many effects which are four times greater than thoic produced by a body which has half the initial velocity. If the velocity be triple, quadruple, \&c. the effects are nine times, if times, \&c. greater ; and, in fhort, are proportional, not to the velocity, but to its \{quare. This obfervation laad been anade before by Dr Hooke, who has enumerated a prodigicus varicty of important cafes in which this projortion of effed is obferved. Leibnitz, therefcre, affirmed, that the force inherent in a moving body is proporional to the fyuare of the velocity.

It is evident that a body, moving with the fame re. bocity, has the fame inherent force, whether this be emplojed to move another body, to bend forings, to rile in oppolition to gravity, or to penetrate a mals of foft matter. Therefore thefe meafures, which are fo widely diffeenent, while cach is agreeable to at numerous clus of facts, ire not meafures of this fomething inherent in the moving body which we cill its firce, but are the meafures of its exertions when modificd according to the cacumblances of the cafe; or, to featr fill more cantionfy and fecurely, they are the meafurcs of certain clafles of phenmena comfequent on the action of a moving body. It is in vain therefore, to attempt to fuppat cither of them by a demonntation. The meafure itfelf is nothing but a definition. The Cartefian calls that a double force which produces a double relocity in the body on which it afts. The Leibnitzian calls Vos. XV.
that a quadruple force which makes a quadruphe pace tration. The reatonings of both in th:c dernomethatima of a propofition in dynamics may be the fames, :3 , whio the refult, thotigh exprefled in difict ont numbers.

But the two medfures are far from being equally proper : for the Laibni viata meafure obliges us in (1) continual violence to the common ufe of word. Whan two bodies mowng in uppofite directions mect, trike cach other, :and Atop, :all men wiil fay that their forces are equal, beeaufe ther have the beft tefl of equality which we ean devife. Or when wo brdicy in motion frike the parts of a inachine, foch as the oppolite ams of a lever, and ate thas brought completely to rell, we and all men will prononnee their mutnal chergizs by the intervention of the malline to be equad. Nuw, in all thefe cales, it is well known that a perfor cquality is found in the products of the çuantities of mather ind veloc:ty. Thus a ball of two pounds, moving with the relocity of four feet in a fecond, will toop a bath of cighe pounds moving with the velocity of one foot per iecond. But the followers of Leilnitz fay, that the force of the firf ball is four times that of the fecond.

All parties are agreed in calling gavity a uniorm or invariable accelerating force; and the definition which they give of fuch a force is, han it always pfoduces the lame accoleration, that is, cqual accelerations in equal times, and therefore produces augmentations of velocity proportionable to the times in which they are produced. The only effest afrribed to this furce, and confequently the only hing which indicates, characterifes, and meafures it, is the augmentation of velocity. What is this velocity, confidered not merely as a mathematical term, but as a phomomenon, as in event, it production by the operation of a natural caufe? It cannot be conceived any other way than as a determination to move on forcver at a cortain rate, if nothins thall change it. We camot conccive this very clemply. We feel onrelves forced to animate, as it were, the body, and give it not only a will and intention to move in this manner, but a ral exention of fome faculty in confequence of this determination of mind. We arc confcious of fuch a train of nperations in ourfilves; and the laft ftep of this train is the exertion or energy of fome natural faculty, which we, in the utmon proprictr ot language, call force. DY fuch analogical conzeption, we fuppefe a fomethine, an encrgy, inhorent in the moring body; and its onty. oflice is the prodution and continuation of this motion, as in our own cafe. Scientific curiofity was among our latelt wants, and language was fomed long hefore its appearance: as we formed anaiogical ennceptione, we contented ourfelse. with the worde already fumiliar to us, and to this fomething we gave the name Force, which exprefied that ene-gy in ourfelies which bears fome re:cmblance (i:a office at laaf) to the determination of a body' to move on at a certain rate. 'Ilis fort of alicgoly pervades the whale of our cosceptions of natural operations, and we can hardly thint: or fpeal of any operation without a hanshage, winch fuppics the nimation of mater. And, in the prefent cafe, there are \((f)\) many points of iefemblance between the effeits of ofur exertimens and the operations of nature, that the lomgrage is moll cxprefive, ant hats the Atrongef appearance of papricty. liy cxenting our force, we mot only move and licep in motian, but we move other bodies. Juf fo a ball not mily morcs,
\(\underbrace{\text { Quartity: }}\) but puts other bodies in motion, or penetrates them, \&c.-This is the origin of that conception which to forcilly nbtrudes itfelf into our thoughts, that there is inherent in a moving body a force by which it produces changes in other bodics. No fuch thing appears in the fime body if it he not in motion. We therefore conclude, that it is the production of the moving furce, whatever that has been. If fo, it mult be conceived a. proportional to its producing caufe. Now this force, thas produced or exerted in the moving body, is only another way of conceiving that determin ution which we call velocity, when it is conceived as a natural event. We can form no other notion of it. The ris infita, the determination to move at a certain rate, and the velocity, are one and the fame thing, confidered in diferent relations.
Vis is ifita.
\({ }^{5}\) Tomer
v.lio
virium vi-
varum. \&c. in his l'onthumous Wurke,
* Micro- before Huyghens) who remarked*, that in all the eafes yraphia, vis of the gradual production and extinstion of motion,
Trfitutiva, the fenfible phenomenon is proportional to the fquare yraphia, vis of the gradual production and extingion of motion,
Trfituciva, the fenfible phenomenon is proportional to the fquare

Thercfore the vis infla corpori moventi, the determination to move at a certain rate, and the velocity, fhould have one and the fame mealure, os any one of them may be talien for the meafure of the other. 'The velocity being an object of perception, is thercfore a proper meatiare of the inherent force; and the propriety is more evident by the perfect agreement of this ute of the words with common language. For we conceive and expefs the adion of gravity is uniform, when we think and firy that its effects are proportional to the times of its action. Now all agree, that the velocity produced by gravity is proportional to the time of its action. And thus the meafure of force, in reference to its produ:cing caufe, perfectly agrees with its meafure, independent of this confideration.

But this agreement is totally lof in the Leibnitzian dofrine; for the body which has fallen four times as far, and has fuftained the action of gravity twice as long, is fild to have four times the force.

The quaintnefs and continual parados of expreffion which this meafure of inherent force leads us into, avould have quickly exploded it, had it 1.0 been that its chicf abettors were leagued in a keen and acrimo. nious warlare with the Britifh mathematicians who fupported the claim of Sir faac Newton to the invention of flusions. They rejoiced to find in the elegant writings of Huyghens a phyfical principle of great extent, fuch as this is, which could be fet in comparifon with fome of the wonderful difcoveries in Newton's l'riuc:pia. The fact, that in the mutual actions of bodies on cach other the products of the maffes aud the fquares of the velocities remain 2lways the fame (which they call the confervatio rivium vivarun), is of almof univerfal extent; and the knowledge of it enabled them to give ready and elegrant folutions of the moot abtrufe and intricate problems, by which they aequired a great and deferved celebrity. Dr Robert Hooke, whofe obfervation hardly any thing efeaped, was the firt (long of the produced or extinguilhed velocity.

John Bernoulli brought all thefe facts together, and fyltematized them according to the principle advanced by Huyghens in his treatife on the centre of ofcillation. He and Daniel Bernoullii gave moll beautiful fpecimens of the prodigious ufe of this principle for the folution of difficult phytical problems in their differtations on the motion and impulfe of Auids, and on the commu-
nication of motion. 'It was however very early objected to them (we think by Marquis Poleri), that in the collifion of bodies perfealy hard there was no fuch confir. vatio virium vivarum; and that, in this cafe, the furces mult be acknowleásed to be proportional to the velocities. The objections were unanfwerable.-But Jchn Benculli evaded their foree, by afirming that there were and could be no bodies perfeatly hard. This was the origin of another celebrated doarine, on which Leibnitz greatly plumed himfelf, rue haw of Con- Law of Tinutis, viz that nothing is obferved to change ab- continu ruptly, or per folum. But no one will pretend to fay that a perlietly hard body is an inconceivable thing; on the contrary, all will allow that foltnefs and compreffibility are adjunct ideas, and not in the leaft necefrary to the conception of a particle of matter, nay totally inconpatible with our notion of an ultimate atom.

Sir Iface Newton never conld be provoked to engage in this difpute. He always confidered it as a wiful abure of words, and unworthy of his attention. He guarded againft all polifility of caril, by giving the molt precife and perficuous definitions of thofe meafures of forces, and all other quantities which he had occafion to confuder, and by carefully adhering to them. And ia one propolition of about zo lines, viz. Great fo the 3yth of the Ift book of the Puincipia, he explain- riority ed every phenomencon adduced in fupport of the Leib. Newtut nitzian doftine, flowing them to be immediate confequences of the action of a force meafured by the velocity which it produces or extinguihes. There it appears that the heights to which bodies will rife in oppofition to the uniform acion of gravity are as the fquares of the initial velocities: So are the depths to which they will penetrate unifermly refifing matter: So is the number of equal fotings which they will bend to the fame degree, \&c. icc. \&cc. We have had frequent occafion to mention this propofition as the mof extenfively ufeful of all Newton's difcoveries. It is this which gives the immediate application of mectianical principles to the explanation of natural phenomena. It is inceffantily employed in every problem by the very perfons whe hold by the other meature of forces, although fuch conduct is virtually giving up that meafure. They all adopt, in every inveftigaticn, the two theorems \(f \dot{i}=\dot{v}\), and \(\dot{f}=v \dot{v}\); both of which tuppofe an accelerating force \(\int\) proportional to the velocity ou which it produces by its uniforma astion during tic time \(t\), ond the theorens \(f f=v^{2}\) is the 39 th I. Princip. and is the confervatio virium viturum.
This famous difpute (the only one in the circle of mathematical fcience) has ied us tomewhat afide. But we have little more to remark with refpect to me:furable quantity. We cannot fay what varietice of quantity are fufceptible of Alria meafure, or that it is impofible to give accurate meatiures of every thing furceptible of augmentation and dimination. We affirm, however, with confidence, that pain, pleafure, joy, \&cc. are not made up of thicir own parts, which can be contemplated feparately : but they niay chance to be affociated by nature with fomething that is meafurable ; and we may one day be able to align their der rees with as mucl precilion as we now afeertain the degrees of warmth by the expanfion of the fluid in the thermometcr. There is one fenfe in which they may all

\section*{QUA [7t>] QUA}

Quantily be meafured, viz. numerically, as Newton meafntes
II denfity, wis motrix, \&ic. We can conceive the pain of Quarels. each of a dozen men to be the fame. Then it is ewident that the pain of eight of thefe men is to that of the remaining four as two to one ; but from fiuch menfuration we do not forefee any benefit likely to arife.

Quander, in grammar, an affection of a fyllable, wherchy its neafite, or the time wherein it is pronouncad, is afeertained; or that which determines the fyllable to be long or fhort.

Suntity is alfo the object of profody, and diftingrithes verie from profe; and the ceonomy and arrangement of quantities, that is, the diftribution of long and thort fyllables, makes what we call the number. See lootry, Part III.

The quantities are ufed to be dininguiflech, among srammarians, by the characters", thort, as perr; and-, lons, as rös. There is alfo a common, variable, or dubous quantity ; that is, fyllables that are one time taken for thort oncs, and at another time for long ones; as the firf fyllable in Allas, patres, \&e.

QUARANTINE, is a trial which thips mult undergo when fufpected of a peftilential infution. In England it may be ordered by the king, with advice of the privycouncil, at fuch times, and under fuch regulations, as he judges proper. Ships ordered on quarantine mult repair to the place appointed, and muft continue there during the time preferibed (generally fix wecks) ; and mut have no intercourfe with the fhose, except for neceflary provilions, which are conveyed with every polible precaution. When the time is expircd, and the goods opened and expoled to the air as dirceted, if there be no appearance of infection they are admitted to port.

Ships infected with the peftilence mult proceed to St Helen's Pool in the Scilly iflands, and give notice of their fituation to the cuftomhoufe officers, and wait till the king's pleafure be known.

Perfons giving falle information to avoid performing quarantine, or refufing to go to the place appointed, or efeaping, alfo officers appointed to fee quarantine petformel, deferting their office, neglecling their duty, or giving a falfe certifiate, fuffer death as felons.

Gondis from Turkey, or the Levant, may not be landed withont licenfe from the king, or certifeate that thes have been landed and aired at fome foreign port. See Plague.

QUARLES (Francis), the fon of James Quarles cierk to the board of green cloth and purvejor to queen Elifabeth, was borm in 1592 . He was edncated it Cimbridge ; became a member of Lincoln's inn ; and was for fome time cup bearer to the Qucen of Bohe\(\mathrm{m} \cdot \mathrm{a}\), and chroncloger to the city of London. It was probabiy on the ruin of her affairs that he went to Ireland as fecretary to archbithop Uher; but the tronbles in that kingdom forcing him to return, and not finding iffairs more at peace in England, fome difquiets he met with were thought to have hatened his death, which happencd in \(16+4\). His works both in profe and reve are numerous, and were formenly in great efeem, particularly his Divine Emblems: but the obs. folete quaintnefs of his flyle has caufed them to fall into negens excepting among particular chincs of renders. "The nuemery of Quarles, lays a late author, has been branded vith more tioan conmon abufe, and lie feems to inave beca cenfared merely from the want of being re ad

If his poetry failed to gain him friends and redice e, t.is \(12{ }^{2}\) " \(\quad\) - 8 piety floould at leaft have fecured him peace and groo!will. He too often no doubt, mitook the enthre fiafn of clerotion for the infpisation of fancy ; to mis the waters of Jordan and Helicon in the lame cup. was referved for the hand of DJition; and for him, and him only, to find the bays of asoant Oli"et equald? verdant with tho of Parnallus. lot, as the effitions of a teal poetical mind, however thwarted by urtowardnefs of fubject, will be foldem rendered totalily abortive, we find in Quarles criginul intagery, frikins fentiment, fertility of expreilion, and lappry curnbins. tions; tomether with a comp:eflon of thle that mo. rits the obfervation of the writers of verfo. Grofs deficiencies of judgment, and the intelinity of lis fubje:t., concurred in ruining him. l'erhaps no circumitnocs whatever can give a more enmplete itea of Quatles's degradation than a late edition of his embletis; the following palizge is extrasted from the preftes': " Dir Francis Quaries, the author of the Emblems that go under his neme, was a man of the roof cxempluy finy, and had a deep intirght into the myteries of our holy religion. But, for all that, the book ibelf is written in 10 old a language, that many parts of it are icurce intelligiole in the prefent age; many of his plarales ate fo affected, that no perfon, who has any tatte for reading, can perute them with the lealt degree of pleafire ; many of his exprefions, are harf, and fometimes whole lines are included in a paranthetis, by which the mind of the reader is diverted from the principal object. His Latin mottos under each rut can be of no fervice 10 an ordinary reader, becaufe he camnot underftind them. In order, therefore, to accommodate the public with ann edition of Quatles's Emb? ems properly modernifed, this work was undertaken." Such an exhibition of Quarles is chaining Columbus to an oar, or making Jolu Duke of Marlborough a train-band corporal."

QUARRIES, a name commonly piven to a molt extraordinary cavera under the city of Pais, the exitence of which is known to few even of the inhabitanes, and many of thofe who have heard of it confider the whole as an idle fory. Mr Thomas White, however, member of the Royal in dical Society of Edinburgh, \&c. who vilited it in 1784 , puts the maticr beyond a douht ; having, with many others, obtained lave (which is vory cautionly granted) to infpect it, having guides and torches with them. He gives the frllowing account of it in the fecond volume of the Manchefer Tranfac. tions. "At the entrance by the Obferatoire Roval, the path is narrow for a coniderable way; but fon we cu. tered large and fpacious flreets, all narked with names, the fame as in the eity; different advertifemonis and bills were found, as we proceeded, patted on the walls, fo that it had every appearance of a large town fwal. lowed up in the earth.
"The general height of the ronf is abont y or 10 feet; but in fome parts not lefs than 30 and cren fo. In many phaces there is a liquor continually dropping from it, which congeals immediately, and forms a fpecies cot tranfurat llone, but not fo fine an I clear as rock corftal. As we concinncl our pergaination, we thotehas ouriclves in no fmall danger from the roof, which wh found but indifierently propped in tome plaees witis wood much deciyed. Under the houles, and natiy of the ftrects, however, it femed to be tolerably lecined by immenfe fones fet in montar ; in other pants, where

\section*{QUA [ 748] RUA}

2゙urtes.
there are onity fieds or gariens above, it was :otally umfupported for at conliderable fpace, the roaf bing peafectly level, or a plane pisce of rock. After traverting :bout two miles, we agaia defeended avout 20 fleps, and here found fome workmen in a very cold and dimp piace, propping up a moof dangerous part, which they were fearful would give way every moment. The puth lere is not more than three fiet in width, and the roof is low, that we were oblizel to Itoop cuntideraby.
"On walking fume little difance farther, we entered int a kind of faloon cut out of the rock, and faid to be cuatly under the Eglife do St \%ocques. This was fllmmated with great bate, ocationed an agrecable faprife, and made us all ample amends for the danger and difficulty we had jut before gone through. At one end rais a reprefentation in miniature of fome of the princiaal forts in the Indies, with the fertifications, drawbridges, \&ec. Camnons were planted with a couple of foldicrs to each ready to fire. Continels were placed in different parts of the garrion, particularly beiore the governor's houfe; and a regiment of armed mea was drawn up in another place with their general in the front. The whole was made up of a kind of clay which the place affords, was ingenioully contrived, and the light that was thrown upo:i it gave it a very pretty effect.
"On the other fide of this hall was a long table fet out with cold tongues, bread, and butter, and fome (f the beft Burgundy I ever drank. Now every thing was hilarity and mirth; our fears were entirely difpelled, and the danger we dreaded the moment before was now no longer thought of. In fhort, we were all in good fpirits again, and proceeded on our journey about two miles farther, when our guides judged it prudent for us to afcend, as we were then got to the teps which lead up to the town. We here found ourfelves fafe at the Val de Grace, near to the Englifh Benedictine convent, without the leaft accident having happened to any one of the party.2 We imagined we had walked about two French leagues, and were abfent from the furiace of the earth betwixt four and five hours.
"There were formerly feveral openings into tha quarrics, but the two 1 have mentioned, viz. the Obfrevatory and the I'al de Grace, are, I believe, the only ones left; and thefe the infpestors keep eonitantly locked, and rately open them, except to frangers particulatly introduced, and to workmen who are always employed in fome part by the king. The police thought it a neeeffary precaution to fecure all the entrances into this cavern, from its having been formerly inhabited by a famous gang of robiers, who infefted the country for many miles round the city of Patis.
"As to the origin of this quary, I could not, on the frictet inquiry, learn any thing fatisfatory; and the only account I know publifhed is the following contained in the Tableaux de Paris, nouvelle cdition, tont premier, clajitre 5mes, page 12mo.
"For the frat buidding of Pais it was neceffary to get the fone in the environs; and the coniumption of it was very confiderable. As Patis was enlarged, the fuburbs were infenfibly built on the ancient quarries, io that all that you fee withont is effentially wanting in the earth for the foundation of the city: lience groeeed the frightful cavities which are at this time
found uncer tie houfes in feveral quarters. They fianit upon abylfes. It would net reciuire a very violent frock in throw back the fones to the place from whence diey hare been raited with io mucli dificuly. Eiglit men being fwillowed up in a gulnh 150 fee: deep, and fome other leis known accidents, excited at length the vigilance of the police and the government, and, in fat, the buildings of teveral quarters have been privately propped up; and by this means a lupport given to thefe obfcure fubterraneous places which they before wanted.
"All the fuburbs of St James':, Harp-1treet, and even the freet of Touncr, fand upon the ancient quarties: and pillars have been erefed to fuppert the weight of the houles. What a fubject for reflections, in conlidering this great city fermed and fupported by nseans abfolutely coutrary ! Thefe towers, thefe fteeples, the arched roofs of thefe temples, are fo many digns to tell the eye that what we now fee in the air is watatig under our leet."

QUARRY, a place under ground, out of which are got marble, freenone, flate, limefone, or other matters proper for building. See Strata.

Some limeltone quarries in Fife are highly worthy the attention of the curious, on account of an amazing mixture of fea-bodies found in them. One of this kind wats opened about the year 1759 , at a farm ealled En:derteel, in the neighbomhood of Kirkaldy, belonging to General St Clair.
The flakes of the fone, which are of uncqual thicknefs, moft of them from eight to ten inches, lie horizontally, dipping towards the fea. Each of thefe flakes, when broken, prefents to our view an amazing eollection of petrified fea bodies, as the bones of fiftes, falks of fea-veed, vat quantities of fhells, fuch as are commonly found on thofe coafts, hefides feveral ethers of very uncommon figures. In fome places the fhells are fo numerous, that little elfe is to be feen but prodigicus eluters or concrations of them. In the upperanof fratum the fhells are fo entire, that the outer cruft or plate may be fcraped off with the finger ; and the flalks of the fea-weed have a darkifa colour, not that glofiy whitenefs which they have in the heart of the quary. The fmalleft ray's or veins of the thells are deeply indented on the fone, like the impreilion of a feal upon was. In thort, 100 fpot at the botton of the occan could exhibit a greater quantity of feabodies than are to be found in this folil rock; for we have the fieletons of feveral fifhes, the antente or feelers of looters, the roots and falks of fea-weeds, with the very caffule which eontain the foed. The place where all theie curiofities are found is on ans eminence about an Englifh mile from the fea; and as the ground is pretiy reep the whole way, it may be 200 feet higher at leaf.

There are two or three things to be remaked here. 1. That armeng all the bodies we have mentioned, there are none but what are fpecifieally heavier han water. This holds fo confantly twe, that the feat weed, which float: in water when the plant is entire, has been Itripped of the broad leaves, which rake it buoyant, before it has bean lodged here. 2. The fleils have been all cmpty; for the double ones, as thofe uf the fat kinul, are always found fingle, or with one fide only. 3. The ruck feems to lave been gradually de-
ferteca

\section*{QUA}
tides ; for the upper furfoce is all eaten, and hollowed in many places like an honey-comb, jull as we oblerve in flat rocks expofed every tide in the accefs and recefs of the waters. See the article Ses.

Quarri, or Quart, among gitaiers, a pane of glats cue ial a dianomd form.

Quarties are of two kinds, fquare and long; cach of which are of different lizes, exprefed by the number of the pieces that make a foot of ghafs, viz. eighths, teuths, eightecutios, and twentieths : bett all the fizes are cut to the fame angles, the acute angle it the iquare quarrels being \(77^{\circ}\) I \(9^{\prime}\), and \(67^{\circ} 21^{\prime}\) in the long ones.

Quarry, among lumters, is fometimes ufed for a part of the entrails of the beaft taken, given by waty of reward to the hounds.
()UArry, in falconry, is the game which the hawk is in purfuit of, or has killed.

QUARTAN, a meafure containing the fourth part of fome other meafire.

Quartan, a feccies of intermitting fever. See Me. dicine, \(r^{\circ} 153,158\), and 159 .

QUARTATION, is an operation by which the quantity of one thing is made equal to a fourth part of the quantity of another thing. Thus when gold allayed with filver is to be parted, we are obliged to facilitate the action of the aquafortis, by reducing the quantity of the former of thefe metals to one fourth part of the whole mafs; which is done by fufficiently incer fing the quantity of the filver, if it be neceffiry. This operation is callcd quartalion, and is preparatory to the parting ; and even many authors extend this name to the operation of parting. See the article Parting.

QUARTER, the fonth part of any thing, the fraituonal exprefion for which is:

Quarter, in weights, is generally ufed for the fourth part of an hundred weight avoirdupois, or 28 It .

Ufed as the name of a dry menfure, quathor is the fourth part of a ton in weight, or eight bufhels.

Quarter, a term in the manege. To work from quarter to quarter, is to side a horie threc times in upon the firf of the fome liaes of a tquare; then clanging your hand, to ride him three times upon the fecond: and for to the third and fourth; always changing hands, and obferving the fame order.

Quartere, with refpect to the parts of:thore, is ufed in various fenfes : thus the fhoulders and fore legs are called the fore-quarters, and the hips and hinder-legs the lind-quariers. The quarters of a horle's foot are the fides of the coffin, comprehending between the toe and the hetl : the innar quarters are thofe oppofite to one another, facing from one foot to the other; and there are always weaker than the outfide guarters, which lie on the external fides of the colfin. Falfe quarters, are a cleft in the horn of a hore's hoof, extending from the coronet to the floce. A horfe is faid to be quartercaff, when for any diforder in the cofflu we are obliged to cut one of the quartes of the hoof.

Quarter, in aftronomy, the fourth part of the monn's period: thus, from the new mon to the quadrature is the firt quarter; from this to fill moou, the fucond quarter, ic.

Quartir, in heraldry, is applicd to the parts or
members of the firft divifion of a
cd, or divided into four quarters.
Franc enikfin, in heraldry, is a quarter fingle o: ahome; which is to polfets one fourth part of the fiell. It makes one of ilie honoarable cranaries of a coat.

QU,GATER of a /bip, ther part of the thip's fide which lies towards the fiem; or which is conjprelicmed be. tween the aftmoft end of the main chairs and the fias of the ftern, where it is teminatel \(b\); the quarterpieces.

Although the lines by whech the guarter and boes of a fliip, with refpect to her lengh, are only imazinary, yet experience appe:trs fufficiently to have afeerthined their limits: fi) that if we were to divide the thip's fides into five equal portions, the mames of cach fpace would be readily cnouglr exprefled. Thus the firft, from the fern, would be the quarter; tha fecond, abaft the midflips; the third, the midhips; the fouth, before the midhips; and the fifth, the bow. Whether thefe divilions, which in reality are fomewhat aroitrary, are altnigether improper, may be readiy difonvered by referring to the mutual lituation or approacin of two adjacent vefels. The enemy boardod us on the larboard iide! Whereabouts? Abaft the midhips, before the midhips, Ec.

Plate CCCCXXVII. \(n^{n}\) I, reprefents a geometrical elevation of a quarter of 74 gun thip. A the keei, witl? a the fale keel beneath it. E the Rem-poit. DD the quater-gallery, with its ballufrades and windows. EE the quarter-pieces, which limit and form the outline of the flern. Fithe talarel, or upper picces of the Remp. FG the profile of the fern, with its galleries. H the gun-ports of the lower-deck; 6 the gun-ports of the upper and quarter.deck. I the alter-part of the mizenchamel. K the wing tranforn. KG the lower counter. LB the fation of the deck:tranfom. IQ the afterpart of the main-wale. DR the after-part of the channel-wale, parallel to the main-wale. SU the theerrail, parallel to both wales. T t the rudder. At F the rake of the fern. Pi ithe drift-rills. TU the after-part of the load zuatcr-itive; \(k, k l\) the curve of the feveral decks correfinnding to thofe reprefented in the head. Sec the article HEans.

As the marks, by which veficls of different confrustionsare diftinguifhed from each other, are genc. rally more confpicuous on the ftern or quarter than any other part, we have reprefented fome of the quartere, which aftume the mof difierent flapes, and form the greatel contraft with each nther. \(\mathrm{N}^{\circ} 2\). fhows the Item and quarter of a Dutch fight. No 3. the flem and rquarter of a.cat. No + . is the fern and quarter of a common galley. \(N^{0} 5\). exhibits the quarter of a firt-rate galley, otherwife called a gallecf: \(N^{\circ}\) G. the quarter of a Dutch dogger, or galliot. No 7. reprefents the feern and quarter of a floop of war.

The quartes of all other thips have a near affinity to thofe above exhibited. Thus all flips of the line, and Eaft Indiamen, are formed with a quarter little differing from the principal figure in this plate. Xebecs have quarters nearly refembling thofe of galeafies, only fomewhat highor. Hagboats and pinks approach the figure of cats, the former being a little broader in the ftem, and the latter a little narrower; and the ferns and quarters of cats feem to be derived from thole of fiyboats. boats. The flerns of Dutch doggers and gralliots are indced fingular, and like thofe of no other modern velfel: they have neverthelefs a great refemblance to the fhips of the ancient Greciams, as reprefented in medals and other monuments of antiquity.

On the Quartar, may be defined an arch of the horizon, contained between the line prolonged from the fhip's ftern and any diftumt object, as land, fhips, \&cc. 'Thus if the thip's keel lies on an ealt and weft line, the fern being weftward, any difant object perceived on the north-weft or fonth-wef, is faid to be on the larboard or flarboard quarter.

Quakrer-Bill, a roll, or lif, containing the different llations, to which all the officers and créw of the thip are quartered in the time of battle, and the mames of all the perfons appointed to thofe fations. See QuAktens.

SH' \(k\) KRR-Mafter, is an oficer, generally a lieutenant, whofe principal bufinefs is to look alier the quarters of the fuldiers, their cloihing, bread, ammunition, firing, \&ic. Every regiment of foot and artillery has a quartur-mafter, and every troop of horle one, who are only warrant-oficers, except in the Blues.

2 \({ }^{2}\) friter-MIufler-General, is a confiderable officer in the army; and flould be a man of great judgment and experience, and well fkilled in geography. His duty is 10 mark the marches and eneampments of an army: he floould know the country perfectly well, with its rivers, plains, marlles, woods, mountains, defiles, paffages, \&c. even to the fmallett brook. Prior to a march, he reeeives the order and route from the conmanding general, and appoints a place for the 'fuarter-matters of the army to meet him neat morning, with whom he marches to the next camp; where being come, and having viewed the ground, he marks out to the regimental quarter-mafters the ground allowed each regiment for their camp: he choolis the head quarters, and appoints the villages for the generals of the army's quarters: he appoints a proper Flace for the encampment of the train of artillery: he conduats foraging parties, as likewife the troops to eover them againt affinlts, and has a thare in regulating the winter-quarters and cantoments.

Quistra Netting, a fort of net work, extended along the rats on the upper part of a thip's quater. In a thip of war thefe are always double, being fupported ly iron cranes, placed at proper diftances. The interval is fometimes filled with cork, or old fails; but chiefly with the hammocks of the failors, fo as to form a Farapet to prevent the execution of the enemy's fmall atmo in battle.
Macke. Comment. the jutices of peace general court held quartery by vol. iv. jutices of peace of each county. This court is 20. 271 . appointed by fat. 2. Hen. V. c. 4. to be in the firt week after Michaelmas-day; the firl week after the Epiphany; the firt week after the clofe of Eafler; and in the week after the tranflation of Saint Thomas a Becket, or the 7 th of July. This court is held before two or mone jultices of the peace, one of whom mult be of the qucrum. The jurididion of this court by 34 Ed. Ilf. c. 1 . extends to the trying and determining of :ill filonies and trefpafies whatinever, though they fellom, if evor, tiy :ay greater offence than fmall fo.
lonies within the benefit of clergy, their comminion proriding, that if any eafe of difficulty arifes, they thall not proceed to judgment, but in the prefence of one of the jufices of the coutts of king 's bench or common pleas, or one of the judges of allize. And therefore murderers and other capital felons are ulually remitted for a more folemn trial to the affizes. They cannot alfo try :ny new-created offence, without exprefs power given them by the fatute which creates it. But there are many offences, and particular matters, which by particular ftatutes belong properly to this juridition, and ought to be profecuted in this court; as, the fmaller mitdemeanors againft the public or commonwealth, not amounting to telony, and efpecially offences relating to the game, highways, alehoules, baftard children, the fertlement and provifion for the poor, vagrants, fervants wages, apprentices, and popilh recufants. Some of thele are proceeded upon by indietment, and others in a fummary way by motion and order thercupon; which order may, for the mott part, unlel's guarded againft by partieular fatutes, be remored into the court of king's bench, by writ of certionar: facius, and be there cilher quathed or confirmed. The records or rollis of the feflions are commisted to the cuftody of a fpecial officer, denominated the culfos rotulorum. In molt corporati a towns there are quarter-feffions kept befure jultices of their own, within their reipzative limits, which have exaely the fame authority as the general quarter-fefions of the county, except in very few infances: one of the molt contiderable of which is the matter of appeals fiom orsers of removal of the poor, which, though they be from the orders of corporation jultices, mult be to the feffions of the county, by 8 and 9 Will. III. c. 30 . In both corporations and counties at large, there is fometimes kept a fpecial or petty teflion, by a few juftices, for difpatching fmaller bufinefs in the neighbourhood beiween the times of the general fellions, as for licenfing alehoufes, paling the aceounts of farith-officers, and the like.

Quarter. Saff, a long faft borne by forefters, parlkeepers, \&c. as a bidge of their office, and accationally ufed as a weapon.
QUARTERS, a name given at fea to the feveral fations where the officers and creve of a thip of war are pofted in adion. See Naval Tactics.
The number of men appointed to manage the artillery is always in propottion to the nature of the guns, and the number and condition of the fhip's crew. They are, in general, as follow, when the hhip is well namned, fo as to fight both fides at once occalionally :
\begin{tabular}{ccccc} 
Pounder. & No. of men. & Pounder. & No. of men. \\
Toa 42 & - & 15 & Toag & - \\
32 & - & 13 & 6 & 6 \\
24 & - & 11 & 4 & - \\
18 & - & 9 & 3 & - \\
12 & - & 7 & & \\
\hline
\end{tabular}

This number, to which is cften added a boy to bring powder to every gun, may be nccafionally reduced, and the guns zeverthelefs well managed. The number of men appointed to the frialla m\&, on board his majeft's fhips and floops on' war, by urier of the admiralty, are,

Rate of the flif.
\begin{tabular}{|c|c|c|c|}
\hline Ift & \multicolumn{2}{|l|}{} & 150 \\

\end{tabular}

The lieutenants are uftially fationed to command the different batterics, and direct their efforts aghime the enemy. The mater tiperintenis the movernents of the thip, and whatever clates to the fails. The boatfiwain, ard a fulficient number of men, is fationed to repair the damaged rimging ; and the graner and carpenter, wherever neceflary, according to their refpective officss.

The marines are generally quartered on the poop and forecallile, or gang-way, under the direction of their cficers: althouzh, on fome occalions, they affift at the great gums, particularly in diftant cannonading.

Quarters, at a fiege, the encampment upon one of the moft principal pallages round a place betieged, to prevent relief and convoys.

Heal Quarters of an Army, the place where the commander in chief has his quarters. The quarters of gencrals of horfe are, if poffible, in villarges behind the right and left wings, and the generals of foot are often in the fame place: but the commander in chief fhould be near the centre of the army.

Quakters of Refrefkinem, the place or places where troops that have been much harafled are put to recover themiclves during fome part of the campaign.

Intrenched Q'ARTEPG, a place forlifed with a ditch and parapet to fecure a body of troops.

Winter Quareers, fometimes means the fpace of time inciuded between leaving the camp and taking the field; but more properly the places where the troops are quartered during the winter.

The firf bufinefs, after the army is in winterquarters, is to form the chain of troops to cover the quarters well : which is done either behind a niver, under cover of a range of Atrong fofts, or under the protcetion of fortified towns. Huffars are very ufeful on this fervice.

It thould be obferved, as an invariable maxim, in winter-quarters, that your regiments be difpofed in brigades, to be always under the eye of a general officer; and, if pofible, let the regiments be fo diftributed, as to be each under the command of its own chief.

QUARTERING, in heraldry, is dividing a coat into four or more quarters, or quarterings, by parting, couping, \&cc. that is, by perpendicular and horizortal lines, \&c.

QUARTO-dechans, an ancient feet in the Chriftian church, who taught that Eafter flould aiways be felehrated according to the callom of the Jews, on the fourteenth day of the monn in the month of March, whenfoever that day fell out. And hence they derived their name quarto de:imani, q. d. Fourteenthers. The Afratics were mightily attached to this opizion, pre-
tending that it was built on the authority of St Jchn, who was their aponte; and pope Victor conld neever bring tiem to obedier.ce in this :irticle, though he vas upon the point of excommanicating them : but it is more probdible te antentai himfelf with menaces. See Eastra.
QUARTY, a genas of filiccous earths very comnion in Europe. According to Kirwan, t.e quarta are in gencral the pure.t of the filiccous kind, though molk of then contai. a flight mixture of other carths: the mof obvious difinction ameng them arifes from their opacity or tramparency. Cronftedt gives the following cha:ateriltics of it: i. It in generally cracked throughout, even in the rock itfelf, whercby, as well as by its own nature, it breaks into irregular and fiarp fragments. 2. It cannot be cafily made red hot, without cracking fill morc. 3. It never decajs in the air. 4. Melted with fised alkalı in a due proportion, it gives a more folid and fixed glafs than any of the other filiceons fomes. 5. When there has been roo interruption in its naturai accletion, it always cryfallizes into hexigonal prifms pointed at bith ends. 6 . It is met with in clefts, filiures, and fmall veins in rocks; it feldom forms large veins, and tell more ra:ely whole mountains, without a misture of heterogeneous iubliances. It is tound,
i. Pure, of feveral varicties, as, ( 1 . Solid, or having no vifible particles, and called fat quartz. This is either travparent, white, blue, or viole-coloured. The firl hind is mer with in the copper-mines in the northern part of Norway and Siberia, and has no regular: form, but is as clear as the fineft cryfallized quartı, or rock cryfal. (2.) Grained quartz, of a white or pale green colour, fonnd in various places in Sweden. (3.) The fparry quartz, which is the fcarcen of the whole, and ought not to he confounded with the white felt-fpar, becaufe it is of a fmoother appearance, and breaks into larger and more irregular planes. It is found of in whitilh yellow, from the gold mines in Hungary; or white, from the ifland of Uto. Bunaich tells us, that the Hungarian gold and filver mines nzar Hodentch, which have reins frequently fome fathons wide, afford a kind of lamellated and porous quartz. It is met with of white, yellow, and blue colours, and it is fometimes finely cryftallized in pyramidical figures.
2. Cryllalizad quartz, nr rock arylal. Sie CRystal.
3. Impure quartz. Of this there are two kinds, (2.) Mixed with iron, in form of a black calx. It is black, glolfy, and contains a great quantiey of iron. It is found in Sweden. (2.) Mixed with copper, and of a red colour, found in the fame conntry.

Crowfedt obferves, that quartz in general, and efpecially its crytals, are very commonly fuppoled, when yet in their foft and diffulved fate, to have included within them fone vegetables, for intlance grats and mofs. "This (fays he) I cannot abfolutels deny ; but it deferves carefully to be examined if that which is fhown as a grafs be not an afeefons, or a flriated cockle; and the mois only branched varietics filled with earth, which, by their being ramofe, bear a vegetable appearance. It is very common in agates, atnd makes them of lefs value than they otherwife would be. '1hhis is mort geneally the cafe with thofe flones which are fhown as including vegetables ; and, for my own part, I
others.'
M. Magellan remarks, that quartz is one of the principal kinds of fone which contain metals. Some of the Hungarian veins contift entircly of it, and the gold is fo misutely diferfed, that it camot be difcemed by the beft microfonpes before it is feparated bs pounding and wafhing. The width of the veins, fome of which are half at fathom, and rome fill more, repay the trouble and expences, which the fimall quantity of gold would not otherwife commerbalance. Nature has not any where produced mountains of pure quartz; for though fome rocks in Sweden are ranked a mong the quartzes, they are undoubtedly mixcd with heterogeneous matiers. Near Lauterberg upon the Hartz are veins of this tone from one to three fithoms wide, confifting of a loof fand, in which they find the copper cre in nelts. In the Danifh :12 of Amhalt we nicet with triangula: quartz pebbles. There are likewife cryftals of quartz liaving water inclofed in them; fome fine pieces of this kind are to be met with in the Timperial cabinet at Vienna, sec.

Rock crytals are generally found upon or among quartz, and arc to be met with in all parts of the world. The greateft number are furnithed to the European countries from Mount Saint Gothard in Swit\%erland.Here large pieces, weighing from 5 to 800 pounds, were found at Grinfelberg; one of 1200 pounds was found lome years ago at Fifbach in the Wallais; and at piece fix feet long, four broad, and equally thick, was lound in the illand of Madugaticar, a plice where thefe natural productions are of the molt extraordinary lize and perfection.

When great quantities of đuartz are cottinually agitated by the fea or river water, they are fomectimes reduced to fuch very minute parts:as to be calfly carried away, fufpended in the water ; and there are fands of fo minute a lize as to meafure lels than the two or three hundreth part of an inch. There are called quickfands. Inmmenfe tracts of land confift oniy of loofe fands, particularly along the fica-fhore ia many parts of Europe. Sume fuppofe that fuatwater has the power of producing this fand out of its own fubtance; and their furfices, in gencral, are fo polifhed, as to fhow that they could not be reduced in ficc by rubbing againft each oth r ; but we know not as yet that fuch a production has ever been demonftated. When fund is anout as big as peas, it is called gravel ; and when it is free from faline and heterogeneous particles, it is \(\mathrm{cm}-\) ployed in making mortar, and other economical purpotes. That which is wery purc firves for making time1afs, with red calces of lead, and the proper alkiline flnx; but when mised with ferruginous black fand, the glafs affumes a greenith black colour. "This (fiys M. Magellan) I have feen among the various fpecimens of Shas made by Mr E. Delavii, F. R. S. who produced at vers fine tranfarent and colourless glats ont of the fame fand with which he had made fome of that black glats, and this only hy feparatirg from it all the ferriginous mixture,"
QUASHING, in law, the overthrowing and annuiltug a thing.

QUASL-contpact, in the civil law, an af without ihe trict form ot a contrat, but jet laving the force thereof. In a contraft there muft be the mutual confont of both parties, lut in a quafecontraza one party
may be bound or obligated to the other, without having given his confent to the act whereby he is obliged. For example: I have done your bufinefs, in your abfence, without your procuration, and it has fucceeded to your advantage. I have then an adion againft you for the recovery of what I have difourfed, and you an action againit me to malke me give an account ot my adminithation, which amounts to a quafectutrat.

2Uast-Crima, or 2 tafi-dolia, in the civil law, the attion of a perfon who does damage, or cvil, iavciuntarily. 'The reparation of quafierimes confilts in making grod the dimages, with interen.
OUASS, a fermented liquor dromk in RuCit. Sce

\section*{plasant.}

QUASSIA, in botany: A grinus of the monogynia order, belonging to the decamiria clafs of plants; and in the natural inethod ranking under the 1 th order, Gruinalis. The calyx is pentaphyllous; thete are five petals ; the nectarium is pentaphyllons; there are from two to five feed cafes itauding afunder, and monatiper. mous. There are three fpecies, the amara, fimaruba, and cacelfa er polygama.
The tuafina amara grows to the beight of feveral feet, and fends off many frong branches. The wood is of a white colour and light; the bark is thin and grey: the leaves are phaced aiterately on the branches, and confilt of two pair of oppolite pinnz, with an odd one at the end : all the leafets are of an eliiptical hape, entire, veined fmooth, pointed, feffile, on the upper pagina of a deep grecu colour, on the under paler: the common tootials is articulated, and winged, or edged, on each fide with a leafy membrane, which gradually expands towards the bafe of the pinne: the flowers are all hermopliradite, of a bright red col our, and terminate the branches in long filies: the bractre or fioral leaves are lance-flhaped or linear, coloured, and placedalternately upon the peduncles: the calyx is tmall, perfiftent, and five-toothed: the corolla confifts of five luncethaped equal petals, at the bafe of which is placed the nectary, or five roundilh, coloured, fcales: the filaments are ten, flender, fomewhat longer than the onrolla, and crowned with fimple antherx, placed traniveriely: the receptacle is flefhy and orbicular : the germen is ovate, divided into five parts, and fupports a flender ftylc, longer than the filaments, and terminated by atapering figma: the capfules are five, two-celled, and contain globular leeds. It is a mative of South Americ.a, particularly of Sutinam, and alfo of fome of the Weit Indian inlands. The root, bark, and wood, of this tree hare all places in the materia medica. The wond is molt generally ufed, and is faid to be a tonic, Itomachic, antifeptic, and febrifuge.

The quailia limaruba is comnon in all the wondlands Dr in Jamaica. It grows to a great height and confi- Wright's derable thicknefs. The trumks of the old trees arc llack Paner, and a litt'e furrowed. Thofe of the Fuung trecs are Edin. fmooth and cray, with liere and there a broad yell w frot. The intice bark of the trunk and hanches is white, fibrous, and tough. It tattes fighily bitter. On cutting or Itripp:ng of this bank, no mlky juice iftues, as has been mentioned by various authnrs. The wood is hard, and ufful for buildings. It iplits frecly, and makes excellent taves for fug ir hogithe ids. It has mo renfible bitter tafte. The banches are alternate and ipreading. The leaves are numerous and alturnate. On the upper fide, the: ate fmooth, fliming, and of it
deep green colour: on the under fode they are white. The fowers appeas about the begiming of April. They are of a vellow colour, and placed on fipices beautifully branched.

The fruit is of that kind called a drupa, and is nipe towards the end of May. It is of an cval flape, is black, fmonth, and Thising. The pulp is tlethy and foft; the talle a malenus fiveet. The mut is flatened, and on one fide winged. 'The kernel is fraall, flat; and taltcs fiveet. The natural number of thefe drupa is five on each common receptacle; but, for the moft past, there are only two or threc ; the ieft abort by various accidents. The ronts are thick, and run fuperficially under the furface of the greund to a confiderable diftance. The bark is rough, fcaly, and warted. The intide when freth is a full yellow, but when dry paler. It has but little fmell. The tate is bitter, but not very difagreeable. This is the tulue curtex fimarubx of the flops. This tree is known in Jamaira by the names of mouncaia damfon, litter damfonn and Pave-ruood. The Oneps are fupplied with this bark from Guiana; but now we may have it from our own in inds at a moderate expence. On cxamining the trudifi ation, Dr Wright found this tree to be a fpecies of quafial. Under that name he fent it to Europe, and Linnæus adopted it into his fyfem. There are male flowers on ane tree and female flowers on another; and this is invariably the cafe in Janaica.
Moft authors who have writen on the fimaruba agree, that in fluxes it refores the lof tone of the inteftines, allays their fpaimodic motions, promotes the fecretions by urine and perifiration, removes that lownefs of fpirits attendng dyfenteries, and difpofes the patient to fleep; the gripes and tenefinus are taken off, and the fools are chansed to their natural colour and confiftence. In a moderate dofe, it occafions no diflurbance or uneafinefs; but in a large doze it produces ficknefs at flomach and vomiting. Negroes are lefs affected by it than white people. Dr Cullen, however, fays, "We can perceive nothing in this bark but that of a fimple bitter; the virtues afcribed to it in dy fentery
.ii. \(p\). have not been confirmed by my experience, or that of the practitioners in this country; and, leaving what others are faid to have capcrienced to be further examined and confidered by pracitioners, I can only at prefent fay, that my account of the effect of bitters will perhaps explain the virtues afcribed to fimarnba. In dyfentery 1 have fomad an infufion of chamomile flowers a more ufeful remedy." The quafia excelfa or polygama was named by Sir Jofeph Benks, Dr Solander; and Or Whight, pricrania amiara (fee impranns Amara.) It is ranked, however, by Mr John Lindfay, in a paper in the third volume of the Edinhurgh Tranfactions, under qualia, who gives the following defcription of it. "It is very common in the woodlands of Jamaica, is bcautiful, tail, and Aately, fome of them being 100 fect long and ten feet in circumference eight feet above the ground. The trunk is ftraight, fmooth, and tapering, fending off its branches towards the top. The outlide bark is pretty fmoth, of a light grey or ath colour, from various lichens. The bark of the roots is of a yellow caft, fomewhat like the corte: fimaruba. The inncr bark is tough, and compofed of fine flaxy fibres. The wood is of a yellow colour, tough, but not very hard. It takes a good polifh, and is uied
as footing. The leaves are fub-alternate; th:e fmall leaves are in pairs, from five to eight, fanding oppolite to each other on thert foot Ralks, and ending with an
\(\qquad\) odd one. They are of an oblong owal hlape, and pointed ; the ribs reddith, and the joung leaves ate co. vered with a fine brownith down. 'Whe flowers come out in bunchas or clufters from the lower part of the laft fhoot before the lcaves, and fland on round foulf alks. The flowers are fnall, of a sellowith green colour, with a very furall calyx. The male or barren tree has flowers nearly limblar to the hermaphrodite, but in it there are only the rudiments of a flyle.
"The fruit is a fmooth black drupa, round flaped, and of the lize of a pe.. There is but little pulp, and the nut covers a round kerncl. Thefe drupx are generally three, fometimes two, and often only one, attached fidewile to a roundifh flefly receptacle. It flowers in Otober and November, and its fruit is ripe in December and January. Except the puip of the fruit, every other part of this tree has an intenfely bitter tafte. In talte and virtnes it is nearly equal to the quaffia of Surinam and 1 am credibly informed is fold in London for the quaffia amura; and it may be fufely ufed in all cafes where that drug has been thought proper, whether as an antifeptic, or in calcs of weaknefs in the Itomach and bowels. It may either be given alone, or joined with the Jefuit's bark. The happieft effcis refult from the ufe of this medicine in obftinate remitting fevers from marth miafmata, in agues which had refilted the ufe of Jefuit's bark and in dyfenteries of long ftanding. It is in daily practice in dropfies fiom debility, either in fimple infufions or tincture by itfelf, or joined with aromatics and chalybeates. Dr Drummond, an eminent phyfician inJamaica, prefcribes it with great fuccefs in the above cafes as well as in amenorrhra, chlorofis, dyfpepfia, and in that fpecies of pica called dirteating, fo fatal to a number of negroes.
" The bark of the quaffia polygama, but efpecially the wood, is inteufely bitter. They may both be ufed in various forms. In certain cafes of dropfy, aromatics and preparations are joined to it alfo in amenorthra and chlorofis; and in worm fevers, the cabbage-bank, or other vegetable anthelmintics."

QUATUORVIR, in antiquity, formerly written IIII. Vir, a Roman magiftrate, who has three col. leagues joined with him in the fame adminiftration, and had the care of conducting and fettling the colonies fent into the provinces. There were alfo quatuorwin appointed to infpect and take care of repairs, \(\& c\).

QUAVER, in mufic, a meafure of time equall to hati a crotchet, or an eighth part of a femibresc.

QUAY. Sce liey.
QUEDEC, a handfome and large town of America, and capital of Canada. The firt place taken notice of upon landing here is a fquare of an irregular figure, with well-built houfes on each fide: on the back of which is a rock ; on the left it is bounded by a dinall church ; and on the right are two rows of houfes, parallel to each other. There is another between the church and the harbour; as alfo another long row on the fide of the bay. This may be looked upon as a kind of fuburb; and bet ween this and the great freet is a very fleep afeent, in which they have made fteps for the foot-palfengers to go up. This may be called

\section*{QUE \\ 754 QU E}

Quebec the Upter Town, wherein is the bihop's palace; and 1 Quecn. \(\underbrace{2}\) between two large fquares is a fort where the governor lodges. The Recolets have handfome houfes over-
againft it, and on the right is the cathedral church: over-againft this is the Jefuits college, and between them arc well-built hou'es; from the fort runs two ftreets, which are croffed by a third, and between thefe is a church and a convent. In the fecond fquare are two deicents to the river of St Cbarles. The Hotei Dieu is in the midway; and from thence are fnall houles, which reach to the houfe of the intendant. On the other fide of the Jefuits college, where the church ftands, is a pretty long freet in which is a numers. Almoftall the houfes are built of ftone, and there are about 7000 inhabitants; the fort is a handfome building, but not quite finifhed. Quebec is not regularly fortified : but it camor be cafily taken ; for the harbour is fanked with two taltions, which at high tides are almoft level with the water. A little above one of the baltions is a demi-baltion, partly taken out of the rock; and above it, on the fide of the gallery of the fort is a battery, of 25 picces of cannon: till above this is a fquare fort called the citadel; and the ways from one fortification to another are difficule to pats. To the left of the harbour, on the fide of the road, there are large batteries of cannon, and fome mortars; befides thefe, there are feveral other fortifications not very eafy to be defcribed. In 1711 the Bitilh fitted ont a fleet with a defign to conquer Canada, which failed on account of the rafhnefs of the admiral ; who, contrary to the advice of his pilot, went too near the Seven ifles, and fo loft his largeft fhips, and 3000 of his beft foldiers. It is about 300 miles north-weft of Bofton in New-England. On Oftober 18. 1759, it was taken by the Britifh under the command of General Wolfe, who loft his life in the battle, after he had the fatisfaction to know that his troops were victorious. Admiral Saunders commanded a fquadron of men of war, and did immenfe fervice in reducing this place; there being not a man in the navy but what was active on this occafion, not excepting the failors belonging to the tranfport veffels. After this valuable acquifition, all Canada came under the jurifliction of the crown of Great Baitain. W. Long. 69.48. N. Lat. 46.55.

QUEDA, a kingdom of Alia, in the peninfula beyond the Ganges, and near the Arait of Malacca. The sing is tributary to Siam. The principal town is of the fame name, and faid to contain about 8000 inhabitants; and is fubjeet to the Dutch. It has a harbour, and is 300 miles north of Malacca. E. Long. 100. 5. N. Lat. 7. 5.

QUEDLINGBURG, a town of Germany, in the circle of Upper Saxony, and on the contines of the duchy of Brunfwick. Here is a famous abbey, whofe abbefs is a princefs of the empire, and who fends deputies to the diets. Her contingent is one horfeman and ten fontmen. The inhabitants of the town live by brewing, hufbandry, and feeding of cattle. It is ro miles fouth-eatt of Halberftadt, and 32 weft of Bernberg. E. Long. 11. 34. N. Lat. 52. I.

QUEEN, a woman who holds a crown fingly.
The title of queen is alfo given by way of courtefy ther that is married to a king, who is called by way of difinetion queen-confort ; the former being termed queen-regent, The widow of a king is alfo called queen,
but with lhe addition of dowazer. See Rorat-Fit mis.

QU'REN Charlotte's Sound, is fituated at the northern extremity of the fouthern inland of New Zealand, near Cook's Strait, lying in 41. 6. of fouth latitude, and 174. 19. of eat longitude. The climate of this found is much more mild than at Dufky Bay; and though there is not fuch plenty of will fowl and fifh, the de. fect is fufficiently compenfated by abundance of excelInnt vegetables. The hills about the found confite mofly of an argill.accous ftone of a greenifh grey, or bluilh or yellowifh brown chour. A green talkous or nephritic (by the jewellers called jadde) is likewife very common, together with horn-tone, thingle, feveral forts of flinty ftones and pebbles, fome loofe pieces of bafaltes, Arata of a compact mica or ylimmer, with particles of quartz. Hence, Mr Forrefter thinks, there is reafon to believe that this part of New Zeal.nnd contains iron-ore, and perhaps feveral other metallic frubfances. The country is not fo fteep as at Dallsy Bay, and the hills near the fea are gencrally inferior in height, but covered with forells equally intricate and impenetrable. Captain Cook fotwed the feeds of many vegetables in this place, that have ufeful and nutitive roots. He fowed alfo corn of feveral forts, beans, kid-ney-beans, and peafe. 'The dugs here are of the lonyhaired fort, with pricked eais, and refen ble the common fhepherd's cur, but they are very fupid animals. They are fed with filh, and even dogs fleih, and perhaps hulman flefh, which the natives alfo eat. Captains Cook and Furneaux left on thefe iflands a boar and two fows, with a pair of goats, male and female, with fome geefe, in order to benefit the natives and future generations of navigators. They left likewife among them a number of brafs medals gilt, on one fide of which was the head of his prefent majefty, with the infeription George III. King of Great Britian, France, and Ireland, \&cc. On the reverfe, a reprefentation of two men of war, with the names Refolution and Adventure over thenı; and the exergue, failed from England March mbcclexif.

QUEEN-Gold, is a royal duty or revenue belonging to every queen of England during her marriage to the king, payable by perfons in the kingdom and Ireland, on divers grants of the king by way of fine or oblation, \&c. being one full tenth part above the entire fines, on pardons, contradts, or agreements, which becomes a real. debt to the queen, by the name of aurum regina upon the party's bare agreement with the king for his fine, and recording the fame.

2UEEN's-County, a divifion of the province of Leinfter in Ireland; fo called from the popilh Queen Mary, in whofe reign it was firt made a county by the earl of Suffex, then lord-deputy. It is bounded on the fouth by Kilkenny and Catherlogh; by King's coun.. ty on the north and weft; part of Kildare and Catherlogh on the eaft; and part of Tipperary on the weft. Its greateft length from noth to fouth is 35 miles, and its breadth near as much; but it is unequal both ways. This county was anciently full of bogs and wonds, though now pretty well inclofed, cultivated, and inhatbited. The baronies contained in it are feven ; and it fends eight members to parliament.

QuesN-Bee. See Bef, \({ }^{\circ} 3\). \&c.
QUEENBOROUGH, a town of the ille of Shep-
pey in Kent, which fends two members to parli,ment, though confilling only of about 100 low brict houles, ans learce 350 inhabitants. 'the chief employment of the people here is offer drudging ; oyfters being very plentivil, and of a fine flawour. E.Long. O. 50 . N. 1.at. 5 : 25.

QUEENS-EERRY, a town of Scotland, in the fhire of Lothiar, feated on the fouth fide of the river Forth, 9 miles welt of Edinburgh.

QUlil-bing-rou, the capital of the province of Quangti in China, has its name from a flower calied qui \(i\), which grows on a tree refembling a laurel ; it exhales fo fweet and agreeable an odour, that the whole country around is perfumed with it. It is fituated on the banks of a siver, which throws itfelf into the Tan ho ; but it flows witl fuch rapidity, and amidet fo narrow valleys, that it is nether navigable for of any utility to coinmerce. This city is large, and the whole of it is built almon after the model of our antient fortrefles; but it is much inficrior to the greater part of the capitals of the other provinces. A great number of birds ate found in the territories belonging to it, the colours of which are fo bright and vaicgated, that the artilts of this commery, in order to add to the luftre of their filks, interweave with them fome of their feathers, which have a fplendor and beaty that camot be imitated. Quei-ling has under its jurifletion two cities of the fecond clals and feven of the third.

Quer, in natural hitory, is a name grova by the Chinefe to a peculiar earth found in many parts of the eaft. It is of the nature of an indurated clay", and in fome degree approaches to the talcs, as our fteatites and the galattites do. It is very white and abterlive, ufed by the women of China to take off foots from the fkin, and render it foft and fmooth, as the Italian ladies ufe talc of Venice. They frmetimes ufe the fine powder of this fone dry, rubbing it on the hands and lace sfier wathing; fometimes they mix it in pomatun.

QUERRCI, a province of Guienne in France ; bounded on the north by Limofin, on the eat by Rnuergue and Auvergne, on the fouth by Upper Languedoc, and on the weft by Agenois and Perigord. It is divided into Upper and Lower ; and is fertile in com, wine, and fruits. Cahors in the capital town.

QUERCUS, the oak-tree: A genus of the polyandria order, belonging to the nonoecia clafs of plants; and in the natural method ranking under the 5 oth order, Amentacea. The calyx is nearly quinquefid; there is no corolla; the famina are from five to ton in number. The female calyx is monophyllous, very entire, ard icabrous. There is no corolla; the ftyles ase from two to five; and there is an ovate feed. See Oak.

Syecies. 1. Thic robur, or common Englith oak, grows from about 60 or 70 to 100 feet high, with a prodigious large trunk, and monftrous fpreading head; biong leaves, broadelt towards the top, the edges acutely finuated, having the angles obtufe. There is a varicty, laving the leaves finely friped with white. This fpecies grows in great abundance all over England, in woods, forelts, and hedge-rows; is naturally of an amazing large growth; there being accounts of fome above 100 feet fature, with wonderful large trunks and fpreading heads; and is fuppofed to consinue its growth many centuries.
2. 'the prinus, or chefnut-leaved Americas oati, ter us. trows 50 or 60 feet high; laving large nblong-oval inooth laves \(p\)-inted both ways, the calges fratuated. firrated, with the finales uniformby round.
3. The phelles, ne willow-lewed American oak, grows to ar 50 lect high, haviag long narmw fononth entire leaver, like thote of the willaw. There is a vasicty called the diwarf willowe leaved ouk.
4. The albit, or white Virginiun oak, grows 300 of 40 fest high, having a whitih bark, with long ob-liquely-pinnatifid lighe-green leaves, the finufes and angles obtufe.
5. The nigra, or black Virginian oak, frows \(3^{\circ}\) or 40 feet higl, having a dark-coloured bark, large wedge-fhaped ilightly-trilobated leaves.
6. The rubra, or red Virginian oak, grows about 60 feet high, having a dark-greyith bark, long obtufelyfmuated leaves, with the finufes terminated by britly points, and have fometimes red fpotted veins, but ginerally dyeing in autumn to a reddith colour, remaining on the trees late in the feafon.
7. The efculus of Pliny, or cut-lcaved Italian oak, grows about 30 feet ligh, having a purplith bark, oblong deeply-finuated fmooth leaves, and long fienler clofe-fitting acorns in very large cups.
8. NEjlops, or large prickly-cupped Spanifh oak, grows 70 or 80 feet high or more, with a very large trunk, and widely-fpreading head, having a whitifn bark, large ololong-oval dceply-ferrated fmooth leaves, the ferratures bowed backward, and large acorns placed in fingularly large prickly cups. This is a noble djecies, almott equal in growth to the common Englifh nak.

9 Cerris, or fmaller prickly-cupped Spanifh oak, grows 30 or 40 feet high, and has oblong lyre-thaped pinnatifid tranfverfely-jagged leaves, downy underneath, and fmall acorns placed in prickly cups.
10. The ilex, or common evergreen oak, grows 40 or 50 feet high, having a fmooth bark, oval and oblong mudivided ferrated petiolated leaves, downy and whitifh undemeath. The varieties are, hroad-leaved, narrow-leaved, and fometimes both forts and other different thaped leaves on the fame tree, alfo fometinus with fawed and prickly leaves.

1t. The gramuntia or Montpelier holly-leaved evergreen oak, grows 40 or 50 feet high ; and las oblong. oval, clofe-fitting fimuated finonslcaves, downy underneath, bearing a refemblance to the leaves of holly.
12. The fuber, or cork-tree, grows 30 or 40 feet high, having a thick, rough, fungous, cleft bark, and oblong-oval undivided ferrated leaves, downy underneath. This fpecies furnithes that nieful material cork ; it being the bark of the tree, which becoming of a thick fungous nature, under which, at the fame time, is formed a new bark, and the old being detached for. ufe, the tree fit! lives, and the fuccocling young bark becomes allo of the fame thick fpongy wature in fix or feven years, fit for barking, having likewile anothor freth bark forring under it, becoming entk like the others in the like period of time; and in this manner thefe trees wonderfully furnifin the cork for our ufe, and of which is made the corks for bottles, Lun: for barrels, and momerons other ufeful articles. The tree grows in great plenty in Spain and Portural, and from thefe countries we reccive the corts. The Spaniards

\section*{QUE [ \(75^{\circ}\) ] QUE}

Quercus. burn it, to make that kind of light black we call Spanifh black, uled by painters. Cups made of cork are faid to be good for hestical perfons to drink out of The Egyptians made coflins of cork; which being lined with a refinous compofition, preferved dead bodies uncorrupted. The Spaniards line ftone-walls with it, which not only renders them very warm, but corrects the moilture of the air.
13. The coccifera, fcarlet, or kermes oak, grows but 14 or 15 feet high, branching all the way, and of buthy growth; with large oval, undivided, indented, fpinous leaves; and producing fmall glandular excrelcences, called kermes or farlit grain, ufed by the dyers. The fmall farlet glands lound in this tree, is the effect of certain infects depofiting their eggs betwixt the bark of the branches and leaves, caufing an exti:uvadation of the fap, and forming the excrefecnce or fubftance in queltion, which being dried is the karmes or fcarlet paftel.
14. The Molucca, Moluccan oak, commonly called American liwe oak, grows about 40 feet high, having oval, fpear-fhaped, fmooth, entire leaves, and fmall oblong eatable acorns.

All the above 14 fpecies of quercus produce flowers annually in the furing, about April or May, of a yellowith colour, but make no ornamental appearance, and are males and females feparated in the fame tree; the males being in loofe amentums, and the females fitting clofe to the buds in thick leathery hemifpherical calyxes, fucceeded by the fruit or acorns, which are oval nuts fixed by their bafe into rough permanent cups, and moftly fit quite clofe, and fome on fhort footltalks, ripeniwg in autumn; which in the common Englith oak is in great abundance, and often in tolerable plenty on fome of the other forts: thofe of all the kinds ferve for fropagating their refpective fpecies; they are allo excellent food for fwine and deer, the common oak in particular.

Ufes, \&cc. Oak-trees, of all the above forts may be employed in gardening to diverfify large ornamental plantations in out-grounds, and in forming clumps in fpacious lawns, parks, and other extenfive opens; the evergreen kinds in particular have great merit for all ornamental purpofes in gardens. But all the larger growing kinds, both deciduous, and evergieens, demand efteem principally as firt-rate foreft-trees for their timber. The Englith oak, however, claims precedence as a tim-ber-tree, for its prodigious height and bulk, and fuperior worth of its wood. Every poffelfor of confiderable eftates ought therefore to be particularly afliduous in railing woods of them, which is effected by fowing the acorus either in a nurfery and the plunts tranflanted where they are to remain, or fowed at once in the places where they are always to ftand. All the forts will profper in any middling foil and open fituation, though in a loamy foil they are generally more profperous: \(h\) wever, there are but few foils in which oaks will not grow; they will even thrive tolerably in gravelly, fandy, and clayey land, as may be obferved in many parts of this country of the common oak.

The oak is of the utmof importance to Britain, and its cultivation defervesthe utmoftattention. Much, therefore, to the honour of the members of the London Society for encourging Arts, Manufadures, and Conmerce, they have excited paticular attention to it; and many
excellent obfervations, drawn from pratice, will be found in their Tranfactions.

The propagation of the ftriped-leaved varieties of the common oak, and any particular variety of the other ipecies, mult be effected by grafting, as they will not continue the fame from feed: the grafting may be performed upon any kind of oakling-ltocks raifed from the acorns, and train them for flandards like the others.

The oak is remarkable for its flownefs of growth, bulk, and longevity. It has been remarked that the trunk has attained to the fize only of 14 inches in diameter, and of fome to 20 , in the \(\int_{1}\) ace of fourfcore years. As to bulk, we have an account of an oak belonging to Lord Powis, growing in Broomfield wood, near Ludlow in Shrophire, in the year 1764, the trunk of which mealured 68 feet in girth, 24 in length, and which, reckoning 90 feet for the large branches, contained in the whole 1455 feet of tirmber, round meafure, or 29 load: and five feet, at 50 feet to a load.

The Greendale oak, \&c, we have already mentioned (fee \(\mathrm{OAK}_{\mathrm{a}}\) ). In the opinion of many, the Cowthorp oak near Wecherby in Yorkflire is the father of the foreft. Dr Hunter, in his edition of Evelyn, has given an engraving of it. Within three feet of the furtace he fays it meafures 16 yards, and clofe to the ground 62. In 1776 , though in a ruinous condition. it was 85 feet high, and its principal limb extended 16 yards from the bole. The foliage was very thin. If this meafurement were taken as the dimenfion of the real ficm, the fize of this tree would be enormous; but like moft very large trees, its ftem is fhort, fpreading wide at the bate, roots rifing above the ground like buttreffes to the trunk, which is fimilar not to a cylinder but to the fruftum of a cone. Mr Martham fays, "I found it in 1768 , at four feet, 40 feet 6 inches; at five fect, 36 feet 6 inches; and at fix feet, 32 feet 1 inch." In the principal dimenfions then, the fize of the flem, it is exceeded by the Bentley oak; of which the fame writer gives the following account: "In 1759 the oak in IHolt-Forelt, near Bentley, was at 7 feet 34 feet. There is a large excrefeence at. 5 and 6 feet that would render the meafure unfair. In 1778 , this tree was increafed half an inch in 19 jears. It does not appear to be hollow, but by the triaing increafe I conclude it not. found." Thefe dimenfions however, are exceeded by thofe of the Poddinmton oak. It grow's in a piece of rich grafs land, called the Old Orchard Ground, belonging to Boddington Manor-Farm, lying near the turnpike-road between Cheltenham and Tewkfoury, in the Vale of Gloucefter. The ftem is remarkably collected at the root, the fides of its trunk being much more upright than thofe of large trees in general ; and yet its circumference at the ground is about 20 paces ; meafuring with a two-foot rule, it is more than it yards. At three feet higl it is 42 feet, and where fralleft, i. e. from five to fix feet ligh, it is 36 feet. At fix feet it fwells out large, and forms an enormous head, which:has been furnifhed with huge, and probably extenfive, arms. But time and the fury of the wind have robbed it of much of its grandeur ; and the greateftextent of arm in 1783 was eight yards from the flem.

In the Genteman's Magazine for May 1794 we have an account of an oak tree growing in Penthure

Quercus. park in Kent together with an engraving. It is called the Bear or Bear oak, from being fuppofed to refemble that which Camden thought gave name to the county of Berkfhire. The tradition at Penthurft is that it is the very tree plumed on the day that the celebrated Sir Philip Sydney was born. "Some late writers (fays Mir Rawlet) have quelioned this, and think that to have been a different tree, which was cut down forme years ago, and was indeed much larger than this. I rememher being once in the hollow of the prefent oak with the late Sir John Cullum; and his opinion then was, that its antiquity was greater than the period affigned. But, I affure you, the tradition of this place is conftant for this tree; and, in confirmation of it, an old lady of 94 years of age, now living, has told me, that all the tewants unfed to furnith themielves with bough from this tree, to flick in their hats, whenever they went to meet the earls of Leicefter, as was always the cultom to do at the end of the park when they came to elide at their feat here. This fine old oak fiends upon a plain about 500 yards from their vencrable manfion, near a large piece of water called Laucup-reell. Ben Jonfon and Waller have particularly noticed it ; and, from the diflinguilled owners of this place, it may be truly fard to ftand on claffic ground. Within the hollow of it there is a feat, and it is capable of containing five or fix perfrons with ale. The bark round the entrance was fo much grown up, that it has lately been cut away to faciliate the accefs. The dimenfions of the tree are theft :

With refpect to longevity, Limmrus gives account of an oak 260 years old: but we have had traditions of forme in England (how far to be depended upon we know not) that have attained to more than double that age. Mr Markham, in a letter to Thomas Beever, Eq; Bath Papers, Vol. I. p. 79, makes forme very ingenious calculations on the age of tres, and concludes from the increafe of the Bentley oak, \&ir. that the Fortworth chefrut is 1100 years old.

Befides the grand purpofes to which the timber is applied in navigation and architecture, and the bark in tanning of leather, there are other ales of lefs conequince, to which the different parts of this tree have been referred. 'The Highlanders are the bark to dye their yarn of a brown colour, or, mixed with copperas, of a black colour. They call the oak the king of all the trees in the foreft; and the herdfman would think himfelf and his flock unfortunate if he had not a faff of it. The acorns are a good food to fatten fiwine and surkeys; and, after the fevers winter of the year 170g, the poor people in France were miferably contained to eat them themfelves. There are, however, acorns produced from another fpecies of oak, which are eaten to this day in Spain and Greece, with as mach pleafire as chefnuts, without the dreadful compulsion of hunger.

Qurrcus Marina, the Sa Oak, in botany, the name of one of the broad-leaved dichotomous fea.fucufes. It is not agreed, among the late botanifts, what was the
feat oak of Theopliranus; and the mont ancient betanils, Clufius and Crefalpinus, fuppofe it to have been a species of the flarubby coralline ; but that feems by no means to have been the cafe, fine 'Theophrafuns fays his feal oak had a long, thick, and felly leal; whence we may much more naturally conclude it to have been of the fucus class.

QUERIA, in botany: A genus of the trigynia order, belonging to the triandria class of plants; and in the natural method ranking under the zed order, Ca ryoptillit. The calyx is pentaphyllous; there is no comola ; the capfuls is unilocular, and trivalved, with one feel. There are two fpecies, viz. hifpanica and canadenfis.

QUESNE (Abraham du), marquis of Quefne, admoral of the naval forces of France, and one of the greateft men of the lan age, was born in Normandy in 1610. He contributed to the defeating of the naval power of Spain before Qatari ; was dangeroufly wounded before Barcelona in 1642, and on other occasions: he went into the fervice of the Swedes, and became vice-admiral ; gave the Danes an entire defeat, killed their admiral, and took his flip. He was recalled into France in 1647, and commanded the fquadron font to Naples. The fea-affairs of France being much fallen, he fitted out divers flips for the relief of the royal army that blocked up Bourdeaux; which was the principal cause of the furrender of the town. He was very fortunate in the lat wars of Sicily, where be beat the Dutch thrice, and De Ruyter was killed. He alpo obliged the Algerines to fine for peace from France in a very humble manner. In hort, Afia, Africa, and Europe, felt the effects of his valour. He was a Proteltant; yet the king bellowed on him the land of Boachet, and to immortalize his memory gave it the name of that great man. He died in 1688.

QUESTION, in logic, a propofition fated by way of interrogation.

Question, or Torture. See Rack.
QUESTOR, or Questor, in Roman antiquity, an officer who had the management of the public areafuse.
The queftorfhip was the firft office any perfon could bear in the commonwealth, and gave a right to lit in the fenate.

At fife there were only two; but afterwards two others were created, to take care of the payment of the armies abroad, of felling the plunder, booty, \&c. in r which purpofe they generally accompanied the confuss in their expeditions; on which account they were called peregrine, as the frt and principal two were called ursani:
The number of the quefors was afterwards greatly increated. They had the keeping of the decrees of the Senate: and hence came the two officers of quefor orin. cipis, or augufi, fometimes called candidutus principis, whole office refembled in mon refuels that of our fecretaries of fate ; and the qusfor falatii, anfivering in a great mature to the Englifh lord-chancellor.
QUEU'L, in heraldry', fignifies the tail of a beaft: thus, if a lion be born with a forked tail, he is blazoned double-zueved.
QUEVEDO de Villegas (Francifoo), a celebrated Spanifh poet, bora at Madrid in 1570 . He was defended from a noble family, and was made a knight

of St James; but was thrown into prifon by order of Commt Olivarcz, whole adminitration he fatirized in lis verles, atud wats net fet liberty till after that minifter's digrace. Qnevedo wrote fome heroic, lyric, and facetiius pooms. He alfo compofed feveral treatifis on rel gious fubjeits, and has tranflated fome authors into Spanilh. He died in \(16+5\). The moft known whis works are, I. The Spanilh Parnaflus. 2. The Adventurer Bufon. 3. Vilions of Hell Reformed, \&sc. Queredo was one of the greateff fcholars and molt eminent poets of his time. His youth was fpent in the fervice of his country in Italy, where he difinguilhed himfelf with the utmolt fagacity and prudence. His moral dicourfes prove his found doErrine and religions fentiments, while his literary pieces difplay his infinite judgment and refined talte. His great knowledge of Hebrew is apparent from the report of the hiftorian Mariana to the hing, requeling that Quevedo might revife the new edition of the Bible of Arias Montanus. His tranflations of Epictetus and Phocylides, with his imitations of Anacreon, and other Greek authors, fhow how well he was verfed in that language : that he was a Latin fcholar, his conftant correfpondence, from the age of twenty, with Lipfius, Chiflet, and Scioppins, will fufficiently illuftrate. As a poet, he excelled both in the ferious and burlefque ityle, and was fingularly happy in that particular turn we have tince admired in Butler and Sivitt. His library, which conlifted of about five thoufand volumes, was reduced at his death to about two thoufand, and is preferved in the convent of St Martin at Madrid.

QUICK, or \({ }^{2}\) Urcesist Hedge, among gardeners, denote all live hedges, of whatever fort of plants they are compored, to dillingnifh them from deall hedges; but in a more ftriat fenfe of the word, it is reftraned to thofe planted with the hawthorn, under which name thofe young plants or fets are fold by the nurferygardeners who raife them for fale, See the article Hedges.

QUICKLIME, a general name for all calcareous fubitances when deprived of their fixed air; fuch as chalk, limefone, oyller-thells, \&ic. calcined. See CheM1STRY, \(11^{\circ} 511,7+8,837\), and 914 .

Quichlime has the following properties. I. It is entirely foluble in water, with which it unites fo rapidly as to occafion confiderable heat. When expofed to air, it imbibes moilture from thence. When united with as much water as is fufficient to make it a fluid pafte, it is called fluked lime. Witer faturated with quicklime is called time-acater. According to Brandt, lime-water contains abnut one part of quicklime to 700 or 800 parts of water. Slaked lime, or lime-water, being expofed to the atmotphere, attract from thence particles of fixable air which float in ir, by which means the quicklime is rendered mild, infoluble in water, and therefore appears on the furface of the lime-water, or of the flaked lime where this combination happens, in the ftate of mild or combined calcareous earth, convertib'e by a fecond calcination into quicklime, and is called cream of lime.

If the earih diffulved in lime-water be precipitated from thence by :any fubftance containing fixable air, as by mild alkalis or magnefia, it will unite with this air, become mild, and refume its former weight andpr"perties which it pofferfed before calcination. But if it be
precipitated from the water by means of fome fubftance Quicklinc. which does not contain fixable air, but which is m re frongly difpoled than the earth to unite with the water, for intance, fpirit of wine, the catth theus precipitated will be in the fate of quicklime, that is, caullic, and foiable in water.
2. Quicklime unites with acids without effervefence, which is nothing elfe than an extrication of the fixable air, of which quicklime has been already deprived. It neverthelefs futurates as much acid as it would have done if it had not been calcined.
3. Quicklime is more puwerfully difpofed to unite with fixable air than fixed or volatile alkalis, or magnefia. Hence, when treated with thefe fubltances, it takes from them their fixable air, and is itfelf rendered mild, and refored to its orizinal weight and properties. Thus two drams of chalk, having been by calcination reduced to one dr:um and eight grains of quicklime, were thrown into a filtrated folution of an ounce of mild fixed alkali in two ounces of water, and digefted during fome time; by which the calcareous euth became mild, and weighed one dram and 58 gr . By means of maguefia, the caliareons eat th may be precipitated from lime-water; and this earth is found to be mild, and to have deprived the magnefia of its fixable air. By depriving alkalis of their fixable air, quicklime renders them more cauftic and folvent, for the fame reafon that itfelf is by this privation of air rendered more cantic and powerfulls folvent. This increare of caufticity and diffolving power is confiftent with a gencral rule, namely, that the more fimple or lefs compounded any body is, that is, the lefs its general tendency to union is fatisfied, the more difpofed it is to unite with or diffolve other fubfances.
4. Quicklime has a difpofition to unite with fulphur, with which it firnis a hepar of fulphur, fimilar to that made by fulphur united with an alkali, and, like this, foluble in watcr. It is alfo difpofed to unite with oils and with animal and vegetable matters, with refpect to which it difcovers a caufic and corrofive properts.
5. Quicklime mixe 1 with fand forms a mafs which hardens, and is ufed as a cement or mortar.

All thefe properties of quicklime have been the objects of confideration to the chemifts and philofophers; whe have, as ufual, been divided in their opinions on the fubject. The evident refemblance of the action of quicklime to fire, has given occafion for one party to derive all the attive properties of this fubftance from fire; while, on the other hand, its want of heat, and incapacity of fetting bodies on fire, unlefs by an acceflion of water, were oljections altogether infurmountable. On the other hand, thofe who denied the materiality of fire, and affimed that it confifts only in a motion mechanic. 11 l p produced among the particles of bodies, were altugether at a lofs to fhow a reafon why this motion, or any thing refembling it, fhould continue perhaps for months after the exciting caufe is taken away. To remuse this difficulty, fome have had recourfe to the actimo of a latent acid communicated to the quicklime by the fire; and which one chemift (Mr Meyer) has din:nguifhed by the name of acidum pingue. But on this hyputhefis it may be remarked in the firf place, that the dation of acids is a difficule to be explained as that of fire; and, in the fecond place, that as all fubitances, by calcination into quicklime, lofe confiderably of their weight,

Quicklime, wcight, it feems rery improbable that they fhould acquine an acid or any other fubtance which could increafe their weight. Befides, from the experiments of Dr Black, it appears thit the diminution of weight in calcarcons fubttinces is owing to their parting with : quantity of fixcel air, the weight of which is much more conliderable than that of any moilture or fatty matter they contain. The kof, of this fixed air is now alfo mivetally allowed to be the reaton of the canticity of the quicklime, as its fiuperior ateration for fixed air is lonked upon to be the reaton why it rendess fixed and volatile alkalis caulhc like itfelf. The only quefion therefore can be, \(13 y\) what means are the calcarcous eatths deprived of their fixed air? To this queition the aniwer is evident, namely, that the action of the fire expels the fixed air; and if this is the cate, it is evident, that to this actions of fire, continucd, the caultic properties of the lime are owing.

We come now to the difcuffion of the queftion, Whether quicklime is to be contidered as a pure earth, or a combination of it with fomething elfe? -Moft of the chemitts, fince the difonvery of fixcd air, have been inclined to think that quicklime is a pure earth uncombined with any thing elfe, and that it approaches more mearly to the itate of elementary earth than any other. But this opinion feems not to have a folid foundation; for there are other eirths, fuch as the bafis of alum, which as far as they can be examined by us, are equally pure with quicklinet, and yet dicover not the imalleft caufticity, even after the \(m\) f viulent calcination. Befides, from the property which quicklime has of depriving alkaline falts of their fixed air, we may learn, that there exifts in it, when kept by itfelf, a certain principle which prevents it from ablobing again the fixed air, with which it was once fo closely united, except in certain circumftances. It is well known, that fixed alkalis, as well as thofe which are volatile, will abforb fix. ed air from the common atroophere; and hence, tho' they are prepared in the molt cauftic ftate, they will in a very fhort time become nild by an expofure to the atmofphere; nay, it requires no fmall degree of care to prevent the atmofplere from having as much accefs to them as is neceflary to change them from a cauftic to a mild Atate. Now, as thefe fubfances thas attract the fixed air from the atmofphere, it thence appears that the atmofphere parts very readily with the fixed air which it contains. The quicklime, however, though it has a greater attraction for fixed air than the alkalis, yet does not become near io foon mild from expofure to the air as the alkalis which have lefs attraction than itfelf. Hence the necelfary inference numf be, that quicklime, atter being once calcined, inftead of attracting, repels fixed air, uniefs it is placed in certain circunntances, wherein the repelling power is defroyed, and the attractive power again maniferts itfelf. Now it is manifeft, that the power which originally repelled the Gixed air was the attion of fire ; and confequently, while the quicklime refufes to attract fixed air, we mult conclude that it is the fame a ation which prevents the union. Quicklime therefore is not a pure earth, but a combination of a pure earth with fire ; jult as chalk, ce limellone uncalcined, is not a pure earth, but a combination of a pure earth with fixed air. In all cheemical trials, then, where quickline is ufed, the double eleative attraction will manifeft itfelf as much as in a
combination of different falts, metals, and acids. Trhus (luickimme. when water is poured on quicklime, the atmafion bctween that element and earth is Aronger than the attraction between earth and fire. The conequence \(i=\), that the water expels the firc, juft as vitriolic acid poured upon fca-falt expels the marine acid. The fire, then, having nothing with which it can form a chemical combination, becomes fenfible to the touch, filf making the lime very hot, and then gradually dimipating in the atmofphere. However, as the water combines with the earth but in very finall quantity, it can only expel the fire from that quantity with which it does combine; and confequently the lime itill retains its cauftic quality, though in a degree fomewhat milder than what it was originally. We mut alfo confider, that water itfelf has at confiderable attraction for fire as well as for earth; and the confequence of this mat be, that part of the lime will be diffolved in the water, if more of that element is added than what the earth can abforb without loling the form of a dry powder. Hence the origin of lime-water, which is only a fmall grantity of lime in its cantic ftate difflved in a large quantity of water. This difiolution is owing to the double attraction of Gire to carth and water; for as long as the water can admit the calcined earth to that intimate union with itfelf which is called a chemical comlinationg the earth mait ftill retain all the caulticity which the fire gives it, and diffolve in the water. When the earth is in too large quantity to be thus combined with the water, the latter is only abforbed into the pores of the earth, where by its bulk it fplits the fone or calcined matter all to pieces, and reduces it to an impalpable powder, expelling a proportionable quantity of fire from thofe pores which it now occupies. The water, however, is capable of radically diffolving but a very fmall portion of calcined earth : and therefore the Came quantity of quicklime will ferve for preparing lime-water a great number of times over; but at latt a large quantity is left, which feems to be quite inert, and has loft the properties of quicklime. Thofe who have tried the experiment of lixiviating lime with frefh quantities of water till it ceafes to be filluble, have fixed the proportion of foluble matter in the lime at about one-third of the whole; but from Dr Black's experiments it appears that quicklime may all be diffolved in water at once, provided the water is in futhcient quantity. Its inaftivity, thereforc, after repeatect affuffions of water, muf be owing to fome change prodaced by the water; bat whether this is owing to an abforption of all the fire it contained by the great quantity of water, or to a fiupply of fixed air given by the water, has not yet been determined by an experiment.

If, inftead of pouring colll water upon quicklime, we pour that which is already heated, the abtorption is much lefs complate ; becaufe the water, having already a fupertluous quantity of heat, is refifted by that which is contained in the quicklime in a latent tate; and hence it is a general obfervation, that hot water is lefs proper for naking lime than cold. But if we pour on any acid upon quicklime which contains a great quantity of fire in a latent tatte, and has likewife a violent attrastion for the earth, a much greater degree of heat is produced than with fimple wate. With the ritriolic acil, indeed, this is not fo well perceived, if the com-

Quitime mon calearecus earths are made ufe of ; becaufe their \(\rightarrow\) infolubility in this acid diminithes its effect: but if, infleal of thefe earths, we take magnefia newly calcined, lie licat is fo great, that the aqueous vapour, not having time to evaporate flowly, is driven off with a confiderable explofion. If the common calcareous earths, well calcined, are diffolved in the nitrous acid, a moft vielent degree of heat is prodaced; more indeed than in any other cafe where a liquid is concerned: for the nitrous acid itfelf contains a great deal of latent heat ; the quicklime does the fame; and by the intimate union of the earth with the acid, all this latent heat, at leaft a great part of it, both in the quicklime and fpirit of nitre, is difplaced, and attacks the aqueous fluid, as being neareft to it; from whence it is dillipated in the air, or alforbed by the neighbouing finftances. The lame thing happens, only in a leis degree, when the marine acid is employed.

When quicklime is mixed with a folution of mild al. kali, a doable decompolition, and two new compofitions, take place. The quicklime may be confidered as a combination of eath and fire, while the alkali in the prefent cafe afts as a combination of falt and air. Thefe two fubfances, therefore, are no fooner put into fuch circumfances as enable them to act on each other, than the quicklime attracts the air from the alkali, and gives its own fire in exchange, which the alkali takes \(u p\), and thus is rendered cauttic, while the quicklime becomes mild. Neverthelefs, though the alkiali here feems to have the greater attraction for fire, and the quicklime for air ; yet it appears that the alkali is by no means capable of keeping the fire which it has imbibed for any length of time: for no fooner is it expofed to the action of the air, than it parts with the fire which it had imbibed, regains its air, and becomes mild. 'This, however in all probability is owing to its extreme folubility in water while in a caufic fate; for quicklime itfelf, when difolved in water very eaflly regains its fixed air, nay even more than it contains in a natural fate. See the article Salt.

On the whole, then, the properties of quicklime may be explained in a very eafy manner on Dr Black's principle of latent heat. That heat confifs in a latent flate in quicklime, as well as in vapour, we have inconteftable proofs; becaufe, in all cafes where quicklime changes its nature and becomes more mild, a degree of heat is produced, and which is always proportionable to the change made on the quicklime. In the making of quicklime, therefore, the air is expelled, and a proportional quantity of fire enters; in diffolving it in an acid, flaking, \&sc. an acid, air, or water, expels part of the heat, which then becomes fenfible. By long expofure to the air, the heat gradually evaporates; the fixed air refumes its place; and the quicklime being thus increafed in bulk, embraces thofe bodics very clofely which lie neareft to it; infomuch that, when mixed with fand and Aones, it will harden with them almolt into the folidity of a rock (fee Cement and Mortar). When mixed with animal or vegetable finftances, it deflroys or decompounds them, both by the action of its internal heat, and by its attraction for a certain acid contained in the animal fubfances, and an oily matter in the vegetables; and hence its property of burning cloth, though its attraction for the oily
matter juft mentioned makes it an excellent whitener Quikffives when properiy applied. Sec-Beeaching.

QUICKSILIER, or mFRCURY, one of the perfeet metals, and fo fufible that it cannot be reduced to a folid ttate but by the molt intenfe degree of cold, farccly, ifatall, under \(40^{\circ}\) below of Fahrenheit's thermometer. Sec Congelaition. For the method of crtracing quickfilver from its orc, \&c. fee Metallurgy, P. 454 , and 475. For the various preparations, \&ic. from it, fee Chemistry Index at mercury and quichfiluer, and Pharmacy Index at mercury and quickMlver. And for its ufe in medicine, fee Medicine, \(n^{\circ} 350\), and Mercury.

It is found, r. Natise, as in the mines of India, Friuli, Lower Auftria, Denx Ponts, \&ic. flowing through beds of Rone, and collesting in the clifts or cavities of rocks. In thele mines, however, Mr Kirwan is of opinion that it is mixed with fome other metal, as the gl bules into which it is divided are not perfeetly fpherical. In Sweden and Germany it has been found united to filver in form of a hard and fomewhat brittle amalgam. It has alfo been obferved vifibly diffufed through maffes of clay or ftone, of a white, red, or blue colour, and very heavy in Spain and Idria; and in Sicily in beds of chalk.

Mines of quicktilver, however, are very rate, infomuch that, according to the calculations of Hoffman, there is 50 times more gold got every year out of the mines thin mercury and its ores. But Dr Lewis, in his notes upon Newmann, fays, that Cramer fufpects that Hoffman only meant five times inftead of 50 ; but neither the Latin nor the Englifh edition of this author expreffes any fuch thought; on the contrary, he adopts the fame opinion; and only adds, that mercury is much more frequently met with than is commonly believed; but being fo volatile in the fire, it often flies off in the roaling of ores, and efcapes the attention of metallurgifts.

According to Newmann, the mines of Idria have produced at the rate of 231,775 pounds weight of mercury per annum; but thofe of Almaden in Spain produce much more. The chemitts of Lijnn inform us, that their annual produce is five or fix thoufand quintals, or between five and fix hondred thoufand pounds weight. In the year 1717 there were upwards of \(2,500,000\) pounds of quickiliver fent from them to Mexico, for the amalgamation of the gold and filver ores of that country.

At Guacanvelica in Brafil the amnual produce of the mines, according to llomare, amounts to one million of pounds, which are carried over land to Lima, thence to Arica, and lafly to Potoff for the fume purpofe.

Befides thefe mines there are others in Brafl near Villa Rica, where fuch a quantity of cinnabat and native running mercury are found near the furface of the earth, that the black flaves often collect it in good quantities, and fell it for a trifling price to the apothecaries; but none of there mines have ever been worked or taken notice of by the owters. Gold naturally amalgamated with mercury is likewife met with in the neighbourhood of that p'ace ; and it is faid that almof all the gold mines of that country are worked out, by fimply wafhing them out with maning water, after reducing into powder the hard ores, which are fometimes imbedded in quartzofe and rocky matrices.

In the duchy of Deux Poats and in the Lower Aum Atia

\section*{QUI}
flria the quickfilver flows from a fchiftofe or fony matrice, and is probably, fiys Mr Kirwan, mixed with fome other motal, as its gloluules are not perfectly fpherical. The mines of Friuli are all in fimilar beds or ftrata. The metal is likewife found viribly diffufed through maffes of clay or very heavy ftonc, of a white, red, or blue colour; of which hat kind are the mines of Span, fome of ldria, and of Sicily. Mafcagni found fluid quickfilver, as well as native cimabar and mincral ethiops, near the lake of Travale in the ducly of Sieman ; but the quantity was fa fmall as not to be worth the evpence of working. On the other hand, the fillowing mines afford profits to the owners after clearing all cxpences, viz. thofe at Krenmitz in Hungary; at Horowitz in Bohemia; Zorge in Saxony; Wolfitein, Stahlberg, and Moefchfeld in the Palatinate. Mercury is allo brought from Japan in the Ean Indies; but the greatef part of what is fold in Europe as Japan cimabar is faid to be manufactured in Holland.

Lemery, lomet, and others, lay cown fome external marks by which we may difinguith thofe places where there are mines of quickfilver, viz. thick vapours like clouds anifing in the months of April and May; the plants being much larger and greener than in other places: the trees feljom bearing flowers or fruit, and puting forth their leaves more flowly than in other places; but, according to Neumann, thefe marks are far from being certain. They are not met with in all places where there is quictifiver, and are obferved in places where there is none. Abundance of thefe cloudy exhalations are met with in the Hartz foreft in Germany, though no mercury lias ever been found there; to which we may add, that though valt quantities of mercurial ores are found at Almaden in Spain, none of the abovementioned indications are there to be met with.

Native mercury was formerly fought from the mines of Idria with great avidity by the alchemifts for the purpofe of making gold; and others have fhowed as ridiculous an attachment to the Hungarian cinnabar, fuppofing it to be impregnated with gold; nay, we are informed by Neumann, that not only the cinnabar, antimons, and copper of Hungary, but even the vine trees of that country were thought to be impregnated with the precious metal. Not many years ago a French chemift advertifed that he had obtained a confiderable quantity of gold from the afhes of vine twigs and ftems, as well as of the garden foil where they grew; but the Falfehood of thefe affertions was demonfrated by the count de Lauragais to the fatisfaction of the Royal Academy of Sciences.

The reduction of mercury into a folid flate, fo that it might be cmployed like filver, was another favourite alchemical purfuit. But all proceffes and operations of this kind, fays Neumann, if they have mercury in them, are no other than hard amalgams. When melted lead or tin are juft becoming confiftent after fufion, if a fick be thruft into the metal, and the hole filled with quickfilver, as foon as the whole is cold, the mercury is found folid. Macquer informs us, that mercury becomes equally folid by being expofed to the fumes of lead. Maurice Hoffman, as quoted by Neumann, even gives a procefs for reducing mercury, thus coagulated, to a flate of malleability, viz. by repeatedly melting and quenching it in lintfeed oil. Thus, he Voz. XV.
tells us, we oltain a metal which con le formed into rings and other utenfils. But here the mercury is entirsly diflipated by the repeated fution, and noilaing, but the original lead is left. Wallerius, after mention:ing frong loap:leys, or cautic lisivium, and fome other lituors proper for tixing quickfilver, telis us, that by means of a certain gradatory witer, the compofition of which he learned fiom Creuling de Aureo V'̈llere, be couid make a corrgulum of mercury whenever he pleafed, of fuch confittency that great part of it would refift cupellation; but what this gradatery watcr was, he has not thought proper to lay before the public.
2. Native procipitate fer fo, in which the metal is mineralized by aterial acid. This was hately found in Idria, in hard compatt maffes of a brownifa yed colour and granular texture, mixed with fome globules of native mercury. An hundred parts of it aftord 91 of running mercury.

Various little globules of mercury werc contained in this ore, which are rendered wery vilible by being heated, but are foon rcabforbed by cooling. On expofing it to the fire in an iron fpnon, the red colour fuon became more vivid, but turned yellowifh on cooling. Diftilled in a pmeumoniac apparatus, a quantity of dephlogifticated air was produced, though lefs by one fourth than what fhould have been produced by an equal quantity of cinnabar. On difilling an ounce of this ore in a glafs retort, a little yellow powder was left, which weighed a fourth part of a grain, and Itained the bottom of the retort in a manuer fimilar to what is done by the calx of filver to white glafs in fimilar circumftances. On cupelling this powder with \(\mathbf{1}+4\) grains of lead wrapped up in paper, the increafed weight of the lead over that of the teft of comparifon fhowed that the calx was reduced into its motallic flate of filver and mised with that of lead.
3. Mineralifed by the vitriolic and marine acids. This kind of ore was firt difcovered in the year 1776, at Obermofchal in the duchy of Daux Ponts. It has a fpar-like appearance, and is either bright and white, or yellow or black, and mised with cinnabar in a fony matrix. The native marine falt of mercury is in the flate of corrofive fublimate.
4. Native cinnabar, in which the metal is mineralifed by fulphur. This is of different fhades from a yellowith to a deep red; and is found either pure in hard friable maffes, either fhapelefs or cryftallifed in cubes, and fometimes tranfparent, or intermixed with clay or Rone, or interfperfed through the ores of other metals, particularly thofe of filver, copper, or martial pyrites. Its texture is either radiated, Atriated, fealy, or gramular. An hundred parts of cimabar contain about 80 of mercury and 20 of fulphur ; but artificial cinnabar contains a little more fulphur, and hence its colour is darker. Its fpecific gravity is alout 7.000 ; it fublimes in clofe veffels, and is decompofed and volatilized in open ones. It is found in the duchy of Deux Ponts, in the Palatinate, in Hungary, Friuli, and Almaden in Spain, and in fouth America, efpecially at Guancavelica in Peru. It is fometimes compact, and fometimes found in tranfparent, ruby-coloured cryflals, and often in a kind of fales or flattened laminx. It is called native vermilion, and cinnabar in flowers, when it is in the form of a very bright red powder. It is alfo found in different earths, in ftenite mixed with iron, with pyrites,
२.ic!-
fiver.

Qaickfi- and with fulphur. Mr Fourcroy caumetates the folfilver. lowing varicties : 1. Thanfarent cinnabar, red and cry-
fallized in very thort triangular prilme, terninated by triangalar pyranids. 2. 'Trandparent red cinnabar, in ofohedral crylals, confiting of two triangular pyra. mids united at their bafes and truncated. 3. Solid compact cinnabar, of a brown or bright red; it is fometimes foliated. 4. Red cinnabar diftributed in frix, nu a flony matrix, or on folid cinnabar. It is fometimes compofed of needles like enbalt. 5. Cinnabar in flowers, or native vermillion. It is of a bright red inlour, and fatin appearance, adhering to different matrices, in form of a very fine powder. It is fometimes eryftallized in very fmall needles, and then greatly refembles the foregoing.

The finer coloured ores of mercury are never workcd for extracting the metal, but ufed entirely as pigments; but they have been very injudicioully preferied for medicinal ufes to the more pure factitious cimnabars ; for we feldom meet wilh any native cinnabar that has not fome earthy or fony matter intermixed with it, nor with two pieces that perfectly agree. There are three varieties principally diftinguifhed in the thops; viz. I. Cinnabar in mafles weighing from one to fix ounces or more. 2. In grains, prepared by breaking the worfe coloured maffes, and picking out the beft coloured bits. 3. Wathed cinnabar, prepared by walhing nver the lighter impurities that are to be found in it. No native cimabar fhould ever be employed in medicine without being previoully puified by fublination. Neumann informs us that le never met with any native cinnabar which did not leave a grey afh or fand, amounting, among different parcels, from one ninth to one fifth of the mineral employed. The reftuum had no gold in it, though the colour of its folution and precipitate gave fome expectation of it at firft fight.

Neumann remarks, that though vitriolic acid forms with mercury a lively yellow concrete, viz. turbith mineral, and with the inflammable principle a yellow fulphur; and though fulphur itfelf forms with mercury a beantiful red cinnabar; yet the fame vitriolic acid deftroys the red colour entirely, rendering it as white as milk. This change is not immediately produced on common cinnabar by the vitriolic acid; but, on being digefted over a ftrong fand heat in a glafs cup, it foon becomes as white as cream; and the vitriolic acid takes the form of a ftrong fulphureous and volatile vapour, very fuffocating and corrofive; emitting very piercing fumes for fome time, which turned the paper that covered it black, and deftroyed its texture.
5. Blach ore of mercury, in which the metal is mineralized by fulphur and copper. This is of a black. ith grey colour, a glafly texture, brittle, heavy, and decrepitating ftrongly when heated. It is found at Murchel Lanberg. An ore of this kind is allo found in the duchy of Deux Ponts. In the fulplur of Idria a black cinnabar is likewife faid to be found, which retains its colour in fublimation; but this is not yet fufficiently confirmed, though it is too bold an affertion of Dr J. R. Forleer that no fuch cinnabar has ever been fourd. He adds, that a certain learned man thought he had difcovered fome near the copper ores at Lauteberg; but that it proved to be a red copper calx, which is till to be met with in that place.
6. Pyritous mercurial ore was brought from Datsphiny by Mr Montigny in 1768 . It is grey, whi. tilh, and friable. An hundred parts yielded one of mercury, one half of filver, the remainder being iron, cobalt, fulphur, and arfenic.
7. An ore of mercury, in which the metal is mineralized with iron by fulphur, is mentioned by Sir Torbern Bergman in his Sciagrapbia, fect. 177. He fays that it is doubtful whether this does not belong to the fpecies of cinnabar, as the iron is perhaps only mechanically diffufed thereon. Mr Mongez informs us, that there are but few inflances of cimabar in which iron is not found in its calcined form, though, in the act of the ore being reduced, it paffes to its netallic flate, and becomes capable of being afted upon by the loadtone.

Another pyritons ore of cinnabar was found at Menidot, near St Lo in Lower Normandy. It confifed of differently fized graine of a red brown colour: they had a vitriolic talle and fulphureous fmell. Pyritous ores of this kind are likewife found at Almaden in Spain, and at Stahlberg in the Patatinate. The cinnabaric pyrites of this latt place are of a dodecaedral form.
8. Mr Gellert informs us, that an ore of quickfilver is met with in Idrid, where the mercury lies in an earth or flone, as if it were in a dead form ; and has the appearance of a red-brown iron-ftone, but much heavier. It contains from three quarters to feven-eighths of the pareft mercury, leaving after difillation a very black Arong earth, giving allo fome marks of cinnabar. For, as we do not know the ultimate divifibility of mercury, we cannot jufly determine the point of its fluidity, although its globules may be no more difcernible.

The liver-ore, which is moft common in Idria, and has its name from its colour, refembles an indurated iron-clay; but its weight difcovers it to have metallic contents. An hundred weight of it fometimes yields 80 pounds of quickfilver.

The brand-erz, or burning ore of the Germans, likewife belongs to this fpecies. It may be lighted at a candle, and yields from 9 to 50 pounds of metal in the 100.
9. Dr Gmelin informs us, that cinnabar mixed with arfenic or realgar is faid to be found in Japan; and that at Morsfield the cinnabar and white calx of arfenic prefent themfelves in the fame rock.
10. Befides the ores already mentioned, we fometimes meet with quickfilver natively amalgamated with gold, fiver, and other metals. This is taken notice of by Bergman ; and from the authoritics of Monet and Prof. Gmelin, Mr Kirwan informs us, that in Sweden and Germany this metal has been found united to filver in an hard brittle amalgam. M. de L'Ille had a fpecimen of this ore from Germany ; which, as M. Mongez informs us, is imbedded in a quartzofe mals, and. mixed with cinnabar. A fpecimen brought from the mine called Carolina, in a cryfalline form, was depo fited in the royal cabinet at the king's garden at Paris. M. de IsIfle likewife informs us, that a fpecimen of native gold was brought from Hungary, which, according to Cronftedt, was probably an amalgam of mocrury and gold. It is compofed of quadrangular prifms, of a grcyifh yellow colour, and britile texture. Neumann likewife obferves, that fometimes a mineral, containing

Quick.
filver.

Qnick. Guer.
containing gold or filver, is met with among mercurial ores, though very rarcly.

Thefe natural amalgams account for the great fpecific gravity of fome hinds of quicklilver. This may procecd from a natural mixturc of gold, though, according to Bocrhanve, it may alfo anite from its being redinililed a great number of times. By a fimilar mode of reafoning we may conclude, that the fmallich fpecific graviiies of quickfilver proceed from its amalgamation with filver, lead, and other metals or femimetals, which in fpite of repeated diltillations may ftill prefcrve their union with it; for Dr Boerhaave informs us that he could not, by any number of difillations, free mercury perfeclly either from tin or lead.
M. Magellan, in his notes on Cronftedt's Mineralogy, fays, "That mercuis is many times found a malgamated with lead, is catily evinced by the procefs of M. Grofic, mentioned by Macquer in his elements of Chemiltry, where the method of extracting mercury fiom fome folutions of lead is defcribed; but the fame Macquer, in his Chemical Dictionary, pofitively affirms, that, though Beccher and Kunckel have both given other procefies for extra\&ting mercury from lead, and though the method pointed out by M. Groffe is eafier than the others, neverthelefs it does not fucceed if the lead be quite pure without any amalgamation with mercury. And Boerhave has exprefsly made the fane affertion, complaining of thofe authors who affirm the contrary." Dr Black, however, feems to be of a different opinion; and, in his public courfe of lectures, teaches that, "by fome proceffes of the more difficult kind, mercury may be extrated from lead;" though he cautions us, at. the fame time, not to infer from this, or any other chemical procefs, the pofibility of the tranfmutation of metals.
Mercury is not in any way altered by the action of light. Its dilatation by heat is extremely regular, as bas lately been fhown, in a very great variety of expetiments, by Dr Adair Crawford; for which reafon it is ufed as the meafure of heat, and thermometers are ufually filled with this metal. When oppofed to the heat of about \(600^{\circ}\) of Fahrenheit, it boils and is difperfed in an invifible fume; which, however, has been obferved to have the elafticity of the fleam of water, and to burft an iron box in which it was attempted to confine it. If it be made to boil in a clofe veffel fitted with a proper apparatus, it will all come over in its proper form, and leave any fixed matter it might contain in the retort. This affords an eafy method of purifying it from the bafe metals with which it is frequently adulterated; though even in this way it is necelfary to raife the fire canticunly, or a part of the fixed motal will be carried up along with the mercury. And even with all the care that can be taken, it has been found impoffible, as has been already faid, to free it perfectly from a mixture of the bafe metals by any number of difillations.

By a very great number of difillations, however, it was faid that fome change might be made upen this metal; and that it became not only purer, but feecifically beavier, by fuch an operation. Boethaave, after making it undergo this operation 511 times, found fome difference; but three -years after, in a Memoir inferted in the Philofophical Tranfactions for 1736 , he acknowledged, that, on repeating the operation 877 times, its
fpecific gravity, as flown hy Dr Craveíande's nice he. droftatic balanee, appeared to be no more than s \(35<0\) to dinilled water.
"Pucrhaave died (fays Mr Magellan in his Notcs on Cronnedt's Nincralogy) two ycars after, on the 23 , 4 of Septenber 1738; and left his papers to his two nephews, Flerman, who died the 7th of Oetoler 1753 , and Kaw, who died five years after. On thcir deatis the manuferipts fell into the hands of Charles Frederick Krufe phyfician to the Emperor of Rufla. This rentleman publifhed a fhort extract from Boerhaavc's Diary in the ninth volume of the Novi Commentarii of the Imperial Academy of Pcteriburg, of which the following are the refults.
"The fpecific gravity of the pureft gold to that of dinlilled water is 19,024 That of mercury ditilled onec in a retort \(\quad 13,570\) Diftilled 1009 times - 13,590 Once from its amalgam with gold - \(\quad 13,550\) 750 times with the fame amalgam - \(\quad 13,520\) 877 times from the fame \(\quad-\quad 13,500\) Once from its amalgam with filver - 33.550 217 times from the fame amalyam - \(\quad 13,500\)
"It is evident, therefore, by thefe fac:s, that mercury does not acquire any additional increafe to its fpecific gravity by the merc repetition of fimple diftillations, nor by its amalgamations with gold or filver, provided it be afterwards properly faturated by fire."

It is ccrtain, however, that there are very confiderable differences in the fpecific gravity of different \{pecimens of quick?ilver; and authors have by no means agreed in fixing the ftandard. - Bergman fates it at 14.110; and Mufchenbroek afferts that fuch was the fpecific gravity of Boerliaave's quick filver that had been difilled 511 times; but fome medern authors, among whom is M. Fourcroy, fate the feecific grasity of this metal at no more than 13.000 . Modern experiments, however, fhow that it is generally about 13.500 or 13.600. "This (fays Mr Magellan) I rm informed was the mean fpecific gravity found by the late Lord Cavendifh, after the repeated and nice trials he made upon 50 different fpecimens of quickfilver, on which he employed all his indultry and attention to determine this point.
"The hydroftatical experiments I lately undertook of this kind upon ten different fpecimens of mercury, two of which were revived from natural and artificial cinnabar by the operator of Mr Kirwan, confirmed me in the fame opinion.
"The temperature of the atmofphere was nearly the mean, viz. at the 5oth degree of Fahrenheit's thermo: meter; and the fcales employed were fo nice, that they turned with the hundredth part of a grain when loaded with four pounds weight. -The method made ufc of to afcertain thefc fpecific gravities is the cafieft of all. A phial of white glafs with a ground fopple was counterbalanced with lead or other matter in a nice pair of fcales. The fubftance to be tuied was introduced into the phial and weighed together, and the weight we fuppofe \(=a\). The remaining fpace of the phial being then filled with dinilled water, we fuppofe the weight now to be \(=b\). Lafly, the phial was filled with difilled water, and the weight fuppofed \(=c\). It is cri-
dent,
\(\qquad\)
\(\qquad\)
dent, that \(b-a=d\), the quantity of water in the fe- er fenfation of its own temperature, this being alwass cond operation; \(c-d=e\), the water whofe bulk is equal to that of the fubltance ; and that \(\frac{a}{e}\) is the fpecific gravity fought for.-P.rrticular care was taken that no bubble of air remained in the infide. For this purpoie a very fmall greove was made with a file on the intide of the glafs fopper ; and this was introduced fidewife without admitting any air, leaving the fuperfluous water to ruif out.
- The greatelt fpecific gravity of any of thofe fpecimens was 13.620 , and the lealt 13.450 . The heavient was neither of the two that had been diftilled from cin. nabar, but a common quickfilver bought at Apothecirics Hall, London; and the lightef was taken from a barometer of the beft and deareft kind made by one of the molt reputed infrument-makers in England.
"The moft obvious caufe of this difference of fpecific gravity in quickfliver feems to be its mixture or amalgamation with other metals. Certainly, when united to gold, its gravity muft of courfe be fyecifically augmented: on the contrary, it mult be leffened when united with any other metal, platina only excepted; and the fame mult be the cafe whether water or any other moifture is mised with it ; for in fuch a cafe the metal will be found heavier after evaporation. A fimple boiling of the quictfilver over the fire in an open veffel will completely frec it from this mixture; and no careful maker of experiments flould negled the preparation before he undertakes to employ mercury in any procefs, or for any purpofe of the philofophic kind. The boiling mult be continued for 20 or 30 minutes in order to expel the whole moifture.

Another caufe by which the fpecific gravity of quickfilver becomes finbject to alteration is the difference of temperature of the atmofphere at the time of making the experiment. Nor is it quickfilver alone, but every other fubltance whofe fpecific gravity is affetted by this caufe in a greater or leffer degree; infomuch that Mr Magellan does not hefitate to pronounce the labours of all thofe who have undertaken to compofe tables of feecific gravities, withuut regard to this circumftance, to be, it not entirely ufelefs, at lealt incapable of affording proper fatisfaction in the nice inquiries that depend on this knowledge.

In Eifenchmid's table of fpecific gravities it is afferted, that a cubic inch of mercury in fummer weighs feven ounces, one gros, 66 grains ; but in winter it weighs 20 grains more: the whole weight then being feven ounces, two gros, 14 grains (allowing 72 grains to the gros). This, however, leaves the mitter almoft in as great uncertainty as before; the fummer and winter temperature being widely diferent in different places, and very often even in the fame place. Unlefs therefore the temperature of the air is attended to at every experiment in taking the fipecific gravity of any fubHance whatever, there can be no certainty of the refult.

Quickfilver always feels cold when touched in the common temperature of the atmolphere. Our fenfations, according to Fourcroy, deceive us in this cafe, for a thernometer dipped in quickfilver always fhows the common temperature. "The great continuity of con:adt between the live frin and numerous metallic particles in an equal fpace, and which are proportional so its great fpecific gravity, neceflarily produces a flrong-
much lefs than that of a living body ; and the multipli. city of thefe points of contact being all at once applicd to this organ of fenfation, mult be more powerfully felt than whenever we touch any other matier that is lighter in itfelf, or of a lefs denfity."

Notwithfanding this apparent coldnefs, however, quickfilver, when expofed to the fame degree of heat, and in the fame circumftances with various other fubftances, foon becomes hotter to the touch than any of them. "The fundamental principle of this (fays Mr Magellan) confifts in the fmall quantity of (pecific fire, or the lefs capacity which mercary is cndowed with of receiving heat. This is fuch, that, compared with the capacity of water for the fame purpofe, it is in the ratio of 0.033 to 100 , as appears by the table of the quantities of flpecific fire contained in various bodies. This table, publifhed in Magellan's Eflay on Elementary Fire, was grounded upon various Important experiments and oblervations made by Mr Kirwan, in confequence of the new Theory of Fire difcovered by Dr Crawford. Hence it fullows, that if equal quantities of heat be communicated to equal quantities of water and mercury, the latter will have a temperature 30 times greater than that of the water; that is to lay, in the inverfe ratio of their refpective capacities, or as 1 to \(30(=0.033: 1.000)\), in the fame manner as it mult happen, whem equal meafures of corn or of any fluid are thrown into vefiels whofe bottoms are as 30 to 1 ; for then their heights muat neceffarily be in their inverfe ratio, viz. of 1 to 30 , scc. See Chemistay, no 1225, \& \({ }^{\circ} \mathrm{c}\).

Quickfilver does not appear to diffolve in water; but Fourcroy remarks, that pliyficians are in the pratice of fuipending a bag full of it in vermifuge ptifaus during their ebullition, and that experience has evinced the good effect's of it. Lemery afferts, that in this procefs there is no lofs of weight ; but this is denied by others. Fourcroy afferts, that this metal, rubbed between the fingers, emits a perceptible odour, though Magellan fays he tried the experiment many times without fuccels.

Fourcroy likewife afferts, that mercury when pure emits a phofphoric light by agitation, particularly in hot feafons. This phencmenon has certainly been ob. ferved in the mercury of the barometer ; but its appearance on other occalions refts entirely on the authority of Mr Fourcroy. Even in the barometer it does not take place, unlefs the Torricellian vacuum be not perfeetly made in the fpace at the top of the tube. Phials of glafs nearly exhautted of air, and containing fome quicklilver hermetically fealed up, will, on being thaken, produce as much light in the dark as is fuffcient to thow the hour on the dial. plate of a watch. But if a perfect vacuum be produced by nicely boiling the quickfilver within the glats, no appearance of this kind is to be perceived. The phenomsnon is certainly of the electrical kind; and its not appearing in the perfect vacuum is owing to the dificulty there is in fetting in motion any large quantity of eleatric matter by itfelf, which indeed can ficaree be done withont producing very violent effects. See Elsctancity-Index.

Mercury unites with all the metals and femimetals, excepting iron and regulus of antiraony. Thefe compounds are callcd amatgans; and Mr Machy has ob-

\section*{Quicik:-} filver.
ferved, that in forming them a centain degree of cold is produced. He made the experiment by covering the ball of a thermometer with tin-foil, and then dipping it into quickfilver; upon which that in the thermoneter fell fome degrees : which agrees perfectly well with the doctrine of latent heat firf difcovered by 1)r Black, as it flows that in this, as well as other cafes, where a body paffes from a folid into at fuid ftate, a degree of cold is produced.-The following obfervations on the amalgams of mercury with differcnt metals are extiacted from the Mcmoirs of the Academicians of Dijon.
I. The amalgan of gold and mercury cryfallifes into quadrangular pyramids. Six ounces of mercury are retained by one of gold in this cryfallization ; but that with filver retains a third part more of quekfilver.
2. The amalgam with filver is likewife fufceptible of cryfallization, and affumes the form of a tree; every ounce of filver retaining eight of mercury. This amalgam, by means of the nitrous acid, well freed from the vitriolic by folution of filver in the fome, forms that curious kind of vegetation mentioned in the article Chemistry, no 754 , called Arbor Diance, or Arbor Philofopborum. -The following is recommended by Mr Magellan as the fhortef procefs:
"Diffolve 228 grains of filver, and half as much quickfilver, in pure nitrous acid. Add to the fulntion, when made, five ounces (of 576 grains each) of diftilled water. Put this folution into a fpherical veliel of white glafs, at the bottom of which mut already be put 432 grains of an amalgam of filver of the conffitence of butter: let the veflel be kept in a quiet place, free from any fhaking or external agitation; and at the end of fome few hours the firgure of a buth or tree of filver will be formed within the water of the glafs veffel. The metals contained in the folution and in the amalgam attradt each other, and a number of fnall tetrahedral cryfals are formed, which lay hold at one another's end, and form the appearance of a vegetation.
3. Copper is amalgamated with mercury with great difficulty, and only by mixiug blue vitriol with mercury and water in an iron retort over the fire. The acid then attacks the veffcl, and the copper is precipitated in a metallic flate, which, by firring it with an hot iron fpatula, unites to the mercury, but does not cryfallize.
4. Two ounces of melted lead poured on a pound of mercury produce a halt fluid amalgam, which being decanted gives fome cryftals like thofe of fllver. One ounce of thefe cryftals retains an ounce and an half of mercury.
5. The amalgam of tin cryftallizes into thin fhining lamellix, with polygonous cavities between one another. Twn ounces of tin retain fix of mercury in this cry. Aallization.
6. Mercury amalgamates with bifmuth by means of heat, and produces cryftals of an ocrohedral form, and lamell:ted triangles and hexagons. They are black on the upper furface, and thining underneath. In this cryfallization the bifmuth rctains double its weight of mercury.
7. Zinc, in fufion, pourcd upon mercury, produces a crackling noife refembling that produced by a hot body thrown into boiling water. It cryftallizes very well into lamellated hexagonal figures, leaving cavities among themiclves. One ounce of zinc retains two and an half of mercury in this cryftallization
8. Quickfivir does not amalgamate with al fenic, cr. cept by heat, and then only in very fmall quantity. 'This metal anfwers very important purpofes both in medicine and the arts. 'lhough it has no perceptible talte, it produces very remarkable effeets on the fomach and inteftines of animals, as well as on the furlace of the fkin. Infects and worms are extremely fenfible of this effect, and the metal, almon in any thate, is cxceedingly pernicinus to them. lhyficians, therefore, employ it as an excellent vermifuge (fee Mrdicine, p. 34t.), and it is likewife one of the m"ft powerful remedies in the matcria medica for many obfinate diforders befides thofe of the venereal kinci, in which its efficacy has long been celebrated. "Even the moft virulent produed o: mercury (fays Mr Magellan), known by the name of fublimate corrofive, which is the molt violent poifon, is often taken internally in very minute dofes, under the direation of Rkilful phyficians, and produces the moft happy effeits in a great variety of cafes even of the moft defperate kind. This is a fact which I have experienced myfelf, in a dreadful forbutic complaint which I fuffered for above four years, with reflefs and violent pains in the eyes and head. None of the moft able phyficians in London and Paris I confulted afforded me any effectual relief, till I had the good fortune to confult Mr Sacre furgeon-oculif at Antwerp. His prefription confifted of three grains of fublimate diffolved in a pint of common proof fpinit. The dofe conlifted in taking every morning two fpoonfuls of it in a pint of new milk. In lefs than two months I began to feel relief; and in three months time was completely cured. The firft methodical practice of this remedy was communicated to the celebrated Van Swieten, firf phyfician to the Emperor's court, by the late 1)r A. R. Sanclies, then chief phyfician to the court of Peterburg, as appears by the laft volume of the Commentaries of the fame Van Swieten, publifhed in 1772. This volume was publifhed after the author's death; but he had cnjoyed during his life the glory of being the author of this wonderful remedy, which continues to bear his name among the igzorant and inaciurate phyfocians of our times."

But whatever ufes this falt may be put to when tal ken in fmall quantities, it is certainly not lefs violent than arfenic itfelf, if taken in a large dofe; and the danger is the greater, on acconnt of the difficult folution of the falt, which requires for tbis purpofe 19 times its weight of water. Alkaline falts, however; prove a very effectual antidote, and will inffantly relicve the fymptoms; but, on account of the infolubility of the poifonous falt, the diforders occafioned by it foon return, and require a repetition of the fame remedy. In cafes where alkaline falts are not immediately at hand, foap diffolved in water will anfwer the fame purpofe ; or if this alfo fhould not be infantly procurable, chalk, lime, fpirit of hartforn, or magnclia alba, might be ufed with good effest.

Quickfilver is employed in Chili and Peru to extrait gold and filver, when native, from the carthy matters with which they are mixed. Thé principle on which this method is founded is the ferong mutual attraction betwixt mercury and the precious metals. -By reafon of this the fmalleft particles either of gold or filver form an amalgam with the mercury, part of which is ftraincd off, and the remainder either feparated by diqillation

2lii: li-
filuer.

OLik-
fiver, Quickmatch.
fillation in iron retorts, or by a kind of diftillation per d ferifum; putting it in a kind of metallic hieve over a velfel of water, to acccive the mercury, which is driven down by a fire lighted in a vellel above the amalgam.

The amalgam with gold ferves alfo to gild copper or filver, fo that they appear as if made of folid gold. Fur this purpole the pieces are to be well cleaned, and then dipped in a weak aquaiortis; then in an nitrous folution of quickfliver, which covers them with a kind of filvering. After this the amalgam of gold is very equally fpread over them; whiclı being dune, the piece is expofed to a leat fufficient to volatilize the quickfllver, and the gold is then left ftrongly adhering to the metal. The only ufe to which the amalgam of mercury with lead has hitherto been applied, is the luting glafs veffels in which fpecimens of natural hiftory are to ve preferved in fpirit of wine. For this it is more proper than any other fubftance, having an excellent effect in preventing evaporation. The amalgam of tin is commonly employed in making looking-glaffes or mirrors. The thin fhect of tin is laid down on a large flat table of flone; a proper quantity of mercury, in which fome tin has already been diffolved to prevent it from deAroying the tin flueet, is rubbed over with a bunch of cloth like a flat bung, and the glafs carefully flided upon it from one end to the other, in fuch a manner that the dirty cruft of the quicklliver is driven off before its edge; and the glafs is then loaded with weights all over: by inclining gradually the fone table, the fuperfluous mercury is dicharged, and in a few hours both cohere together. This amalgam is ufed for exciting the electricity of glafs globes in the common electrical machines, but is faid to be inferior in frength to that made with zinc.

Quickfilver heated by itfelf, witl accefs of air, is by degrees converted into a red powder, improperly called Mrercurius precipitaius fer fee. It confilts of the calx of the metal united with the batis of dephligifticated or pure air, which may be expelled trom it again by a ftrong heat; and this was the firit method by which Dr Prieftley obtained this kind of air.

Mercury is not altered by the contad of air: It is only obferved, that it becomes tarnithed by the particles of duft which the air depolits; and from that circumftance mercury has been called the loadftone of duft.Though all bodies have this property, it feems more remarkable in mercury than any other, on account of its great fplendour ; but it is not in the leaft changed by this circumftance, nothing more being neceffary to reftute it to its original brilliancy than filtration through a piece of thamoy leather.

The volatility of metcury prevents it from uniting with earths in the way of fufion; though M. Fourcroy is of opinion that its red calx, or precipitate per fe, might perhaps fix in glaffes, and colour them, as is obferved in the cals of atfenic.

QUICK-match, among artillery men, a kind of combintible preparation tormed of three cotton ftrands drawn into length, and dipped in a boiling compofition of white-wine vinegar, faltpetre, and mealed pow. der. After this immertion it is taken out hot, and laid in a trough where fome mealed powder, moitened with firits of wine, is thoroughly incorporated into the twitts of the cotton, by rolling it about therein. Thus prepared, they are taken out feparately,
and drawn through mealed powder; then hung upon a line and dried, by which they are fit for immediate fervice.

QUID Pro quo, in law, q. d. "what for what," denotes the giving one thing of value for ancther ; or the mutual confidetation and performance of both parties to a contact.

Quin pro quo, or Qut pro quo, is alio ufed in phyfic to exprefs a mitake in the phyfician's bill, where quid is wrote for quo, i . e. one thing for anotleer; or of the apothecary in reading quid for quo, and giving the patient the wrong medicine. Hence the term is in the gencral extended to all blunders or mitakes comnitted in medicine, either in the prefcription, the preparation, or application of remedies.

QUIDDITY, QUIDDITAS, a barbarous term ufed in the fchools for effence. The name is derived hence, that it is by the ellence of a thing that it is tale quid, fuch a quid, or thing, and not another. Hence what is effential to a thing is faid to be quiddative.

QUIETISTS, a religious feet, famous towards the clofe of the laft century. They were fo called from a kind of abfolute reft and inaction, which they fuppofed the foul to be in when arrived at that Itate of perfeetion which they called the unitive life; in which fate they imagined the foul wholly employed in contemplating its God, to whofe influence it was entirely fubmiffive; fo that he could turn and drive it where and how he would. In this ftate, the foul no longer needs prayers, hymns, \&c, being laid, as it were, in the bofom and between the atms of its God, in whom it is in a manner fwallowed up.

Molinos, a Spanih prielt, is the reputed author of Quietifm; though the Illuminati in Spain had certainly taught fomething like it before. The fentiments of Molinos were contained in a book which he publifhed at Rome in the year 1681 , under the title of the Spiritual Guide; for which he was calt into prifon in 1685 , and where he publicly renounced the errors of which he was accufed. This folemn recantation, however, was followed by a fentence of perpetual imprifonment, and he died in prifon in the year 1696. Molinos had numerous difciples in Italy, Spain, France, and the Netherlands, One of the principal patrons and propagators of Onietifm in France was Marie Bouviers de la Mothe Guyon, a woman of fafhion, remarkable for goodnefs of heart and regularity of manners; but of an unfettled temper, and fubject to be drawn away by the feduction of a warm and unbridled fancy. She derived all ideas of religion from the feelings of her own heart, and defcribed its nature to others as the felt it herfelf. Accordingly, her religious fentiments made a great noife in the year 1687 and they were declared unfound, after accurate inveftigation, by feveral men of eminent piety and learning, and profeffedly confuted, in the year 1697, by the celebrated Boffuet. Hence arofe a controverly of greater mo. ment between the prelate laft mentioned and Fenelon archbillop of Cambray, who feemed difpofed to favour the fyftem of Guyon, and who in 1697 publifhed a book containing fevcral of her tenets. Fenelon's book, by means of Boffuet, was condemned in the year 1699 , by Innocent XII. and the fentence of condemnation was read by Fenelon himelf at Cambray, who exhorted the people to refpect and obey the papal decree,

Notwithtanding this feeming acquiefcence, the archbilhop perfifted to the end of his days in the fentiments, which, in obedience to the order of the pope, he retracted and condemmed in a public manmer.

A feet fimilar to this had appeared at Mount Athos in Theildy, near the end of the isth century, called HeJichafls, meaning the fame with Quictills. They were at branch of the myitics, or thofe more perfect monks, who, by long and intenfe contemplation, endeavourcd to arrive at a tranquillity of mind free from every degree of tumult and perturbation. In conformity to an ancient opinion of their principal doetors (who thought there was a celellial light concealed in the decpeft istirements of the mind), they ufed to fit every day, during a certain fpace of time, in a folitary corner, with their eyes eagerlyand immovably fixed upon the middle regions of the helly or navel; and boalted, that while they remained in this polture, they found, in effeet, a divine light beaming forth from their foul, which diffuicd through their hearts inexpreflible fenfations of pleafure and delight. To fuch as inquired what kind of light this was, they replicd, by way of illuftration, that it was the glory of God, the fame celential radiance that furrounded Chrift duing his transfiguration on the Mount. Barlaam, a monk of Calabriit, from whom the Barlaamites derived their denomination, ltyled the monks who adhered to this intitution Mafalians and Euchites; and he gave them alfo the new name of Umbilicani. Gregory Palamas, archbifhop of Theffalonica, defended their caufe againft Barlatam, who was condemned in a council held at Conflantinoplc in the year 1341. -See Fenelon's ATax, des Saints.

The Mahometans feem to be no ftrangers to quietifm. They expound a paffage in the 17 th clapter of the Koran, viz. "O thou foul which art at reft, return unto thy Lord, sce." of a foul which, having, by purfuing the concatenation of natural caufes, raifed itfelf to the knowledge of that being which produced them, and exifts of neceffity, refts fully contented, and acquicfces in the knowledge, \&c. of him, and in the contemplation of his perfection.

QUILLET (Claude), an eminent Latin poet of the 17 th century, was born at Chinon, in Touraine, and practifed phyfic there with reputation: but having declared againtt the pretended poffefion of the nuns of Loudun, in a manufrript trcatife, the original of which was depofited in the library of the Sorboune, he was obliged tu retire into Italy, where he became fecretary to the marthal d'Eftrees, the French ambaffador at Rome. In 1655 , Quillet having publifhed in Holland a Latin poem, entitled Callipedia, under the name of Galvidius Latus, he there inferted fome veries againt the cardinal Mazarine and his family; but that cardinal making him fome gentle reproaches, he retrenched what related to the cardinal in another edition, and dedicated it to him, Mazarine having, before it was printed, given him an abbey. He died in 1661 , aged 59, after having given Menage all his writings, and 500 crowns to pay the expence of printing them; but the abbe took the money and papers, and publithed none of them. His Callipedia, or the art of getting beautiful children, has been tranflated into Englifh verfe.

QUILLS, the large feathers taken out of the end
of the wing of a goofe, crow, \&c. They are denomi- Rein, nated from the order in which they are fixed in the Q wariou, wint ; the fecond and thind guills being the befl for writing, as they have the largett and roundeft barrels. Crow-ruills are chiefly ufed ior drawing. In order in harden a quill that is foft, thrull the barrel into hot afthes, ftrring it till it is foft, and then taking it out, prefs it alnoolt flat upon your knec with the back of a penknife, and afierwards reduce it to a roundnefs with your fingers. If you have a number to harden, fet Water and alum over the fire, and while it is boiling put in a handiul of quills, the barrels only, for a minnte, and then lay them bj.

QUIN (James), a celebrated performer on the Englifit fage, was born at Lendon in 1693 . He was intended for the bar; but preferring Shakefpe:are to the ftatutes at large, he on the death of his father, when it was necelliary for him to do fomething for himfelf, appeared on the ftage at Drury-lane. In 1720, h: frit difplayed his comic powers in the charater of Falltaff, and foon after appeared to as great advantage in Sir John Brute; but it was upon Booth's quitting the Itage that Quin appeared to full advantage, in the part of Cato. He continued a favourite performer until the year 1748 , when, on fome difgut tetween him and Mr Rich the manager, he retired to Bath, and only came up annually to act for the benefit of his friend Ryan; until the lofs of two front teeth foiled his utterance for the flage. While Mr Quin continued upon the fage, he conftantly kept company with the greateft geniufes of the age. He was well known to Pope and Swift ; and the earl of Chefterfield frequently invited him to his table: but there was none for whom he entertained a higher efteem than for the ingenious Mr Thomfon, to whom le made himfelf known by an aft of generofity that does the greatef honour to his charakter; and for an account of which fee our life of Thomson. Mr Quin's judgment in the Englifh language recommended him to his royal highnefs Frederick prince of Wales, who appointed him to inftruct his children in fpeaking and reading with a graceful propriety; and Quin being informed of the elegant manner in which his prefent majefty delivered his firft gracious fpeech from the throne, he cried out in a kind of ecitacy, "Ay-I taught the boy to fpeak!" Nor did his ma. jefly forget his old tutor; for, foon after his acceffion to the throne, he gave orders, without any application being made to him, that a gentecl pention fliould be paid to Mr Quin during his life. Mr Quin, indeed, was not in ablotute need of this royal benelaction; for as he was never married, and had none but diffant relations, he funk 20001 . which was half his fortune, in an amuity, for which he obtained 200 1. a-ycar ; and with about 20001 . more in the funds, lived in a decent manner during the latter part of his life at Bath, from whence he carried on a regular correfpondence with Mr Garrick, and generally paid a vilit to lis friends in the metropolis once a-year, when he contantly pafied a week or two at Mr Garrick's villa at Hampton. He died of a fever in 1766.

QUINARIUS, was a fmall Roman coin equal to half the denarius, and conlequently worth about three pence three farthings fletling. See Money.

\section*{QUI}

It was called quinarius, becaufe it containcd the valne of five affes, in the fome mamer as the denarius was named from its containing ten.

QUINAUC (Philip), a celcbrated French poet, born of a good family at Paris in 1635 . He cultivated poetry from his infancy, and 16 dramatic picces of his were atted between the year 1653 and 1656 . In the mean time, Quinant was not fo much devoted to poetry but that he applied himlelf to the ftudy of the law; and made his fortune by marrying the widow of a rich morchant to whom he had heen ufeful in his profeffion. Quinaut afterwards tumed his attention to the compoling of operas, which were fet to mufie by the famous lully; and Lully was chamed with a pret whofe verfes were not too ncrvous to yield to the capricious airs of mufic. Ite died in 168 ?, alter having enjoyed a handfome penfion from Louis XIV. for many years: and weare told he was extremely penitent in his latt illnefs for all thofe of his compofitions which tended to infpire love and pleafure.

QUINCE, in butany, Sce Cydonia.
QU1NCUNX, in Roman antiquity, denotes any thing that confifts of five twelfths of another ; but particulaty of the as.

Quincunx Order, in gardening, is a plantation of trees, difpofed originally in a fquare confilting of five nees, one at each comer, and a fifth in the middle; which dippofition, repeated again and again, forms a regular grove, vood, or wildernefs.

QUINDECAGON, in geometry, a plain figure with 15 fides and 15 angles.

QUINDECEIVIVIRI, in Roman antiquity, a college of 15 magintates, whofe bufinefs it was to prefide over the facrifices. They were alfo the interpreters of the Sybil's books; which, however, they never confulted but by an exprefs order of the fenate.

QUINQUAGENARIUS, in Roman antquity, an officer who had the command of 50 men.

QUINQUAGESIMA suxday, Shrove Sunday, fo called as being about the 50 th day before Eafter.

QUinQuatria, or Quinguatrus, was a feftival kept at Rome in honour of Minerva, which began on the 18 th of March, or as others will have it on the igth, and lalted five days. On the firt day they offered facrifices and oblations without the effufion of blood; the fecond, third, and fourth, were fpent in hlows of gladiators; and on the fifth day they went in proceftion through the city. Scholars had a vacation during the folemnity, and prefented their malters at this time with a gift or fee, called Minerval. Boys and girls ufed now to pray to the goddefs Minerva for wiflom and learning, of which fhe had the patronage. Plays were aeted, and difputations held, at this fealt, on fubjects of polite literature. The quinquatria were fo called, becaufe they lafted for five days. There feems to be a ftrong refemblance betwixt this feltival and the panathenxa of the Greeks.

QUINQUENNALIS, in Roman antiquity, a magiftrate in the colonies and municipal cities of that empire, who had much the fame office as the xdile at Rome.
QUINQUEREMIS, in the naval architedure of the ancients, a nome given to a galley which had five * See Po. rows of oars. They divided their veffels in general into lycrota. monocrota and polycrota*. The former had only one tire
of rowers : the latter had feveral tires of them, from two or three up to 20,30 , or even 40 ; for fuch a veffel we have an account of in the time of Philopater, which required no lefs than 4000 men to row it.

Meibom has taken off from the imaginary improba. bility of there ever having been fuch a veffel, by redu. cing the enormous height fuppofed neceftary for fuch a number of rows of oars and men to work them, by finding a better way of placing the men than others had thought of. The quinqueremes of the ancients had 420 men in each; 300 of which were rowers, and the reit foldiers. The Roman flect at Metlina confifted of 330 of thefe fhips; and the Carhaginian, at Lilyboum, of 350 of the fame fize. Each veflel was 150 feet long. Thus 130,000 men were contained in the one, and 150,000 in the other, with the apparatus and provifions necelfary for fuch expeditions as they were intended for. 'This gives fo grand an idea of the ancient naval armaments, that fome have queltioned the truth of the hiftory: but we find it related by Pulybius, an hiftorian too authentic to be queltioned, and who expreiles his wonder at it while he relates it.

QUINQUEVIRI, in Roman antiquity, an order of five prietts, peculiarly appointed for the facrifices to the dead, or celebrating the rites of Erebus.

\section*{QUIQUINA. See Cinchona.}

QUINSY, or Quinzs. See Medicine, ne if7183.

QUINTEN, a town of France, in Bretagne, with the title of a duchy, and a handfome caftle. It is feated in a valley near the river Guy, and near a lauge foreft of the fame name, eight miles fouth of St Brieux, and 20g welt of Paris. W. Long. 2.40. N. Lat. 48. 26.

QUINTESSENCE, in chemiltry, a preparation confitting of the elfential oil of fome vegetable fubfance, mixed and incorporated with fpirit of wine.

Quintessence, in alchemy, is a mytterious term, fignitying the fifth or latt and higheft effence of power in a natural body.

QUINTILE, in aftronomy, an afpeet of the planets when they are 72 degrees diftant from one another, or a fifth part of the zodiac.

QUINTILIANUS (Marcus Fabius), a celebrated Latin orator, and the molt judicious critic of his time, was a native of Calagurris, or Calahorra, in Spain; and was the difciple of Domitius Afer, who died in the year 59. He taught rhetoric at Rome for 20 years with great applaufe: and not only laid down rules for fpeaking, but exhibited his cloquence at the bar. Some authors imagine, but with little foundation, that he arrived to the confulfhip; but it is more certain that he was preceptor to the grandfons of the emperor Domitian's fifter. There is fill extant his excellent work, intitled, Infitutiones Oratorix, which is a treatife of rhetoric in 12 books; where his precepts, judgment, and talle, are jultly admired. Thefe inftitutions were found entire by Poggius, in an old tower of the abbey of St Gal, and not in a grocer's thop in Germany as fome authors have imagined. There is alfo attributed to Quintilian a dialosue \(D\) e caufis corruptic eloquentix; but it is more commonly afcribed to Tacitus. The belt editions of Quintilian's works are thofe of Mr Obreight, publifhed at Strafburg in 2 vols 4 to, in 1698 , and of M. Capperonier, in folio. There is an Englifh tranflation by Mr Guthric.

Iuintilians

Quintilian had a fon of the fame name, on whom he beftuws great praifes. This fon ought not to be confounded with Quintilian the father, or rather the grandfather, of him who is the rubject of this article, and who wrote 145 declamations. Ugolin of Parma publifhed the firt 136 in the 15 h century ; the nine others were publifhed in 1563 by Peter \(A\) y rault, and afterwards by Peter Pithou in 1580 . There have alfo been 19 other declamations printed under the name of Quintilian the Orater; but, in the opinien of Voflus, they were written neither by that orator nor his grandfather.
<UINTILIANS, a fect of aucient heretics, thus called from their prophetefs Quintilia. In this feet the women were adnittcd to perforns the facerdotal and epifcopal functions. They attributed extrandinary gifts to Eve for having firlt eaten of the tree of knowledge; told great things of Mary the fifler of Mofes, as hat ving been a prophetefs, \&.c. They added, that Philip the deacon had forr daughters, who were all prophcteffes, and were of their fect. In thefe affemblies it was ufiual to fee the virgins entering in white robes, perfonating prophetefics.

QUINTIN matsys, alfo called the Farrier of Antwerp, famous for being transfurmed, by the force of love, from a black fmith to a painter. He had followed the trade of a blackfmith and farrier near twenty years; when falling in love wirh a painter's daughter who was very handfome, and difiked nothing but his trade, he quitted it, and betook himfelf to painting, in which he made a very uncommon progrefs. He was a diligent and careful imitator of ordinary life, and fucceeded better in reprefenting the defects than the beauties of nature. Some hiftorical performances of this mafter deferve commendation, particularly a Defcent from the Crofs, in the Cathedral at Antwerp: bat his beft known p:Cure is that of the two Mifers in the galiery at Windfor. He died in 1529 .

QUINTINIE (John de la), a celebrated French gardener, born at Pci\&tiers in 1626. He was brought up to the law ; and acquitted himfelf fo well at the bar as to acquire the efteem of the chief magiftratc. M. Tamboneau, prefident of the chamber of accounts, engaged him to undertake the preceptorfhip of his only fon, which Quintinie executed entirely to his fatisfaction; applying his leifure hours to the Itudy of writers on agriculture, ancient and modern, to which he had a ftrong inclination. He gained new lights by attending his pupil to Italy; for all the gardens about Rome being open to him, he failed not to add practice to his theory. On his return to Paris, M. Tambonean gave up the management of his garden entirely to him; and Quintinie applied fo clofely to it, that he became famous all over France. Louis XIV. erected a new office purpofely for him, that of director of the royal fruit and kitchen gardens; and thefe gardens, while he lived, were the admiration of the curions. He lived to a good old age, though we learn not the time of his death; his Directions for the Management of Fruit and Kitchen Gardens are efteemed all over Europe.

QUINTUS calaber, a Greek poet, who wrote a large Supplement to Homer's Iliad, , in 14 books, in which a relation is given of the Trojan war from the death of Hector to the deftruction of Troy. It is conjectured, from his tyle and manner, that he lived in the fifth century. Nothing certain can be collected either
concerning his perfon or country. Ilis poem was firn mode known by Cardinal Defirion, who difonered it in St Nieclas's church, near Otranto in Calabria; from whence the author was named \(\Omega_{\text {uintus }}\) Ca'aber. It was firtt publithed at Venice by Aldus, but it is not faid in what ycar:

Quintus Curtius. Sce Curtius.
QUINZY, Quinsey, or Angina Petaris. Sce Me. dicine, \(1^{\circ}+03\).

QURRE of Paper, the quantity of 24 or \(2 ;\) fhects.

QUIRINALIA, in antiquity, a feaf celcbrated among the Romans in honour of Romulis.

QUIRITES, in Roman antiquity. In confequence of the agrecment entered into by Romulus and 'Iatius king of the Sabincs, Rome was to retain its name, taken from Romulus; and the people were to be called \(\mathcal{L}_{\text {Luirites, }}\) from Cures, the principal town of the Sabines, a name ufed in all public addreffes to the Roman pcople. -Dinn. Hal. fays, that each particular citizen was to be called Remanus, and the collestive body of them Quirites; yet it appears by this ancient form of words ufed at funerals, Ollus Quiris letho datus ef, that each private citizen was alfo called Quiris.

The origin of the word Quirites, which was at firf peculiar to the Sabines, and became, in Romulus's time, the general name of the inhabitants of Rome, has been much fought for; and the mont propable account antiquity gives us of it, is this: The word \(\mathcal{Q}^{2}\) uiris, according to Plutarch and fome others, fignified, in the Sabine language, both "a dart," and "a warlike deity armed with a dart." It is uncertain whether the god gave name to the dart, or the dart to the god. But be that as it will, this \(\mathcal{Q u i r i s}^{2}\), or \(\mathscr{L}^{\text {uiri- }}\) nus, was either Mars or fome other god of war; and the worlhip of Quiris continued in Rome all Romulus's reign : but after his death he was honoured with the name \(Q^{\text {uirinus, }}\) and took the place of the god \(\mathfrak{Q u i r i s}^{\text {u }}\)
QUIRK, in a general fenfe, denotes a fubtily or artful diftinction.
Quirk, in building, a piece of ground taken out of any regular ground-plot, or floor: thus, if the groundplot were obiong of fquare, a piece taken out of a corner to make a court or yard, \&c. is called a quirk.
QUISQUALIS, in botany: A genus of the monogynia ordcr, belonging to the decandria clafs of plants; and in the natural method ranking under the 51 if order, Veprecula. The caly \(x\) is quinquefid and filiform ; the petals five ; the fruit is a quinqueangular plum. There is only one fpecies, viz. Indica.
QUITO, a town of South America, in Peru (fee Prev, [. 213.), feated between two chains of high mountains called Cordillera de los Andes, on much higher ground than the reft of labitable Peru. It is 300 yards ligher than the level of the fea according to the exacteft obfervations. The town is 1600 yards long and 1200 broad, and is the feat of a bihop. It contains about 35,000 inhabitants, one third of whom are originally Epaniards. Among the inhabitants are fome perfons of high rank and diftinction, defcended either from the original conquerors, or perfons who at different times c:me from Spain invefted with fome lucrative pof. The number of thefe, however, is but fmall. The commonalty, befides Spaniards, confift of Meltizos, Indians, and Negroes; but the laft are not
proportionally

Quito propostionally numerous. Merchandizes and commoditics of all forts are extremely dear, partly on account of the difficulty of bringing them.

Thete are feveral religious communities at Quito, and two colleges or univerlities governed by Jefuits and Dominicans.

The principal courts held at Quito are that of the royal audience, which confifts of a pretident, who is governor of the province with regard to law affairs; four auditors, who are at the fame time civil and criminal judges; a royal fifcal, who, befides the caufes brought before the audience, takes cognizance of every thing relating to the revenue; and an officer Atyled the protecior of the Indians, who folicits for them, and when they are injured pleads in their defence. The next is the treatury, the chief officers of which are an accountant, a treafurer, and a royal fifeal. The tribunal of the Croifade, which has a commillary, who is generally fome dignitary of the church, and a treaforer. There is alfo a treafury for the effects of perfons deceafed: an inftitution eftablifhed all over the Indies, for rereiving the goods of thofe whofe lawful heirs are in Spain, in order to fecure them from thofe accidents to which they might be liable in private hands. There is likewife a commifary of the inquifition, with an alguazilmajor and familiars, appointed by the inquifition at Li. ma. The corporation confilts of a corregidor, two ordinary alcaldes, chofen anmually, and regidores. The latter fuperintend the election of the alcaldes, which is attended with no imall difturbance, the people being divided into two parties, the Creoles and Europeans.

QUITTER-bone, in farriery. See there, § xi. 4. QUIT-Rent (quietus redditus, i. e. "quiet rent,") is a certain fmall rent payable by the tenants of manors, in token of fubjection, and by which the tenant goes quiet and free. In ancient records it is called white rent, becaufe paid in filver money, to diftinguifh it from renteorn, \&c.

QUOIN, or Cow, on board a fhip, a wedge fa-
flencd on the deck clofe to the breach of the carriage of a gun, to keep it firm up to the fhip's fide. Cantic quoins are fhort three-legged quoins put between calks to keep them Iteady.

Quons, in architecture, denote the corners of brick or thone watls. The word is particularly ufed for the ftones in the corners of brick buildings. When thele ftand out beyond the brick work, their cdges being chamfred off, they are called ruffic quoins.

QUOTIDJAN, any thing which happens every day. Hence, when the paroxyfms of an ague recur every day, it is called a guotidian ague. See Medicine, \(n^{6} 161-164\).

QUOTIDIANA deceptiva. See Medicine, n? 150.

QUOAD hoc, is a term ufed in the pleadings and arguments of lawyers; being as much as to day, As to this thing the law is fo and fo.

QUORUM, a word frequently mentioned in the ftatutes, and in commiffions both of juftices of the peace and others. It is thus called from the words of the commiffion, quorum A. B. unum effe volumus. For an example, where a commiflion is directed to feven perfons, or to any three of them, whereof A. B. and C. D. are to be two ; in this cafe, they are faid to be of the quorum, becaufe the reft cannot proceed without them : fo a jultice of the peace and quorum is one without whom the reft of the juftices in fome cafes cannot pro. ceed.

QUOTIENT, in arithmetic, the number refulting from the divifion of a greater number by a fmaller; and which fhows how often the fmaller is contained in the greater, or how often the divifor is contained in the divided. The word is formed from the Latin quoties ; \(q\). d. How often is fuch a number contained in fuch another?

In divifion, as the divifor is to the dividend, fo is unity to the quotient.-Thus the quotient of 12 divided by 3 is 4 ; which is thus difpofed, 3 ) 12 (4 quotient. See Arithmetic.

Ror \(r\), a liquid confonant, being the igth letter of our alplabet. Its found is formed by a guttural extrution of the breath vibrated through the mouth, with a fort of quivering motion of the tongue drawn from the teeth, and canulated with the tip a little elevated towards the palate. In Greek words it is frequently afpirated with an \(b\) after it, as in rbapfody, rbetoric, \&cc. otherwife it is always followed by a vowel at the beginning of words and fyllables.
In the notes of the ancients, R. or RO. fignifies Roma; R. C. Romana civitas; R. G. C. rei gerende caufa; R. F. E. D. rate factum et ditum; R. G. F. regis flilius; R. P. res publica, or Romani principes; and R. K. R. F. F. F. [res Romana ruct ferro, fame, flain3!.

Ufed as a numeral, R anciently food for 80 ; and with a dafh over it, thus \(\overline{\mathrm{R}}\), for 80,000 ; but the Greek \(r, \rho\), with a fmall mark over it, fignified 100 ; with the fame mark under it, it denoted \(1000 \times 100\); thus \(p\) fignified 100,000 . In the Hebrew numeration 7 denoted 200: and with two horizontal points over it \(1000 \times 200\); thus \(\ddot{7}=200,000\).

In the preferiptions of phyficians, R or \(\mathrm{B}_{0}\) fands for recipe, i. e. "take."

RAAB, a town of Lower Hungary, capital of Javerin, with a caftle and a bilhop's fee. It is a ftrong frontier bulwark againtt the Turks, and has two bridges, one over a double ditch, and another that leads towards. Alba Regalis. The furrounding country is plain, and

\section*{\(R A B\) \\ [ 7ブ ] \\ K A}

Rabie there is nothing that feems to conimand it but a fmal hill at fome diftance, which is undermined and may be blown up. It was taken by Amurath 11I. with the lofs of 20,000 men; but was durprifed foon after by Count Palfi, who killed all the 'Turks that were found therein. It is feated at the confleence of the rivers R.b and Rabnitz, not fir from the Danube, 32 miles welt of Gran, and 55 fouth ealt of Vienna. E. Long. 17. 25. N. Lat. 47. 48.

RABAC, a fmall port on the Arabian coaft of the Red Sca, in N. Lat. \(22^{\circ} 35^{\prime} 40^{\prime \prime}\) by Mr Bruce's account. 'Ihe entry to the harbour is from the E. N. E. and is about a quarter of a mile broad. The port extends about two miles in length to the eaftward. The mountains are about three leagnes to the north, and the town about four miles north by ealt from the entrance to the harbour. The water is good, and all hips may be fupplied here from the wells which are in the neighbourhood of the town. The country is bare and uncultivated; but from the appearance of it, and the frethnefs of the water, Mr Bruce fuppofes that it fometimes rains among the mountains here, which is the more probable as it is confiderably within the tropic.

RABAT, a large and handfome fea-port town of Africa, in the kingdom of Fez and province of 'Tremefen. It has fine mofques and handfome palaces, and is feated at the mouth of the river Burrigrig, almof in the mid-way between Fez and Tangier. W. Long. 5. 28. N. Lat. 34. 40.

Rabat, together with Sallee, which is oppofite to it, was formerly famous for fitting out piratical veffels; but the late emperor Sidi Mahomet fubdued them both, and annexed them to the empire; fince which time the harbour of Rabat has been fo filled with the fand wath ed in by the fea as to render it unfit to carry on fuch piracies in future.

The town of Rabat, whofe walls inclofe a large face of ground, is defended on the fed-Gide by three forts tolerably well finifhed, which were erected fome little time ago by an Englifh renegado, and furnifhed with guns from Gibraltar. The houfes in general are good, and many of the inhabitants are wealthy. The Jews, who are very numerous in this place, are generally in better circumfances than thofe of Larache or Tangier, and their women are extremely beautiful.

The calle, which is very extenlive, contains a ftrong building, formerly ufed by the late emperor as his principal treafury, and a noble terrace, which commands an extenlive profped of the town of Sallee, the ocean, and all the neighbouring country. There arealfo the ruins of another cafte, which is faid to have been built by Jacob Almonzor, one of their former emperors, and of which at prefent very little remains but its walls, containing within them fome very frong magazines for powder and naval ftores. On the outfide of thefe walls is a very high and fquare tower, handfomely built of cut ft ne, and called the tower of Hoffen. From the we rkmanihip of this tower, contrafted with the other buildings, a very accurate idea may be formed how greatly the Moors have degenerated from their former fplendour and tafte for architecture.

RABBETTING, in carpentry, the planning or cutting of channels or grooves in boards, \&cc.

In thip-carpentry, it fignifies the letting in of the planks of the flip into the keel; which, in the rake and
run of a mhip, is holiowed away, that the planks may join the choler.

RABBl, or RabBins, a title which the Phatifees Rahetaiz. and dofors of the law among the Jews aflumed, and literally fignifies mafters or excell.n's.
'Thete were fiveral gradations before they arrived at the dignity of a rabbin ; which was not cunferred till they had acquired the profoundeft knowledge of the law and the traditions. It does not, however, appeat that there was any fixed age or previous examination neceffary ; but when a man had diftinguithed himfelf by his 1 ill in the written and oral law, and palfed through the fubordinate degrees, he was faluted a rabbin by the public voice.

Among the modern Jcws, for near 700 years paft. the learnci men retain no other title than that of rabbi, or rabbins ; they have great refpect paid them, have the firft places or feats in their fynagogues, determine all matters of controverfy, and frequently pronounce upon civil affairs; they have even power to excommunicate the difobedient.

RABBINISTS, among the modern Jews, an appellation given to the doctrine of the rabbins concerning traditions, in oppolition to the Caraites; who reject all traditions. See Caraite.

RABELAIS (Francis), a French writer famous for his facetioufnefs, was born at Chinon in Touraine about the year 1.483 . He was firt a Francifcan friar ; but quitting his religious habit Itudied phyfic at Montpelier, where he took his doctor's degree. It is faid, that the chancellor du Pratt having abolilhed the privileges of the faculty of phyfic at Montpelier by a decrec of the parliament, Rabelais had the addrefs to make him revoke what he had done; and that thofe who were made doctors of that univerfity wore Rabelais's robe, which is there held in great veneration. Some time after, he came to Rome, in quality of phyfician in ordinary to Cardinal John du Bellay archbifhop of Paris. Rabelais is faid to have ufed the freedom to jeer Pope Paul III. to his face. He had quitted his religious connections for the fake of leading a life inore agreeable to his tafte; but renewed them on a fecond journey to Rome, when he obtained, in 1536 , a brief to qualify him for holding ecclefiaftical benefices; and, by the intereft of his fiiend Cardinal John du Bellay, he was received as a fecular canon in the abbey of St Maur near Paris. Hi, profound knowledge in phylic rendered him doubly ule. ful; he being as ready, and at leat as well qualified, to prefcribe for the body as for the foul: but as he was a man of wit and humour, many ridiculous things are laid to his charge, of which he was quite innocent. Ife publifhed leveral things; but his chief performance is a frange incoherent romance, called the Hifory of Gargantua and Pamagruct, being a fatire upon priefts, popes, fools, and knaves of all kinds. This work contains it wild, irregular profution of wit, learning, obfcenity, low conceits, and arrant nonfenfe ; hence the flrewd. nefs of his fatire, in fome places where he is to be underftood, gains him credit for thofe where no meaning is dilcoverable. Some allutions may undoubtedly have been to temporary and local as to be now quite loft : but it is too muchto conclude thus in lavour of every unintelligible rhapfody; for we were not without Englill witers of great talents, whofe fportive genuifes have betrayed them into puerilities, no lefs incoherent at

Rahbit. the times of writing than thefe of Rabelais appear above two centaries after. He died about 1553 .

RABBIT, in zoology. See Lefus.
The buck rabbits, like our boar cats, will hill the young ones if they can get at them; and the docs in the warrens prevent this, by covering their focks, or nefts, with gravel or earth, which they clofe fo artificially up with the hinder part of their bodies, that it is hard to find them out. They never fuckle their young ones at any other time than early in the morning and late at night ; and always, for eight or ten days, clofe up the hole at the month of the neft, in this careful manner when they go out. After this they begin to leave a fmall opening, which they increafe by degrees; till at length, when they are about three weeksold, the mouth of the hole is left wholly open that they may go out; for they arc at that time grown big enough to take care of themfelves, and to feed on grafs.

People who keep rabbits tame for profit, breed them in hutches; but thefe mult be kept very neat and clean, elfe they will be always fubject to difeafes. Care muit he taken alfo to keep the bucks and does apart till the latter have juft kindled; then they are to be turned to the bucks again, and to remain with them till they fhun and run from them.

The general direction for the choofing of tame rabbits is, to pick the largeft and faireft; but the breeder fhould remember that the tkins of the filver-haired ones fell better than any other. The food of the tame rabbits may be colewort and cabbage leaves, carrots, parfneps, apple-rinds, green corn, and vetches, in the time of the year ; alfo vine-leaves, grafs, fruits, oats, and oatmeal, milk-thiftles, fow-thiftles, and the like: but with thefe moift foods they mult always have a proportionable quantity of the dry foods, as hay, bread, oats, bran, and the like, otherwife they will grow potbellied, and die. Bran and grains mixed together have been alfo found to be very good food. In winter they will eat hay, oats, and chaff, and the fe may be given them three times a-day; but when they eat green things, it muft be obferved that they are not to drink at all, for it would throw them into a droply. At all other times a very little drink ferves their turn, but that mult always be frefh. When any green herbs or grafs are cut for their food, care muif be taken that there be no hemlock among it; for though they will eat this greedily among other things when offered to them, yet it is fudden poifon to them.

Rabbits are fubject to two principal infirmities. Firf, the rot, which is caufed by giving them too large a quantity of greens, or from giving them frefh gathered with the dew or rain hanging in drops upon them. It is over-moifture that always caufes this difeafe. The greens thercfore are always to be given dry; and a fufficient quantity of hay, or cther dry food, intermixed with them, to take up the abundant moifture of their juices. On this account the very beft food that can be given them, is the thorteft and fwcetef hay that can be got, of which one load will ferve 200 conples a year ; and out of this trock of 200,200 may be eat in the family, 200 fold to the markets, and a fufficient number kept in cafe of accidents.

The other gencral difeafe of thefe creatures is a fort of madnefs: this may be known by their wallowing and tumbling about with their heels upwards, and hop-
pine in an odd manner into their boxes. This diftem. per is fuppofed to be owing to the ranknefs of their feeding; and the generdl cure is the keeping them low, and giving them the prickly herb called tare-tbiftle to eat.

The general computation of males and females is, that one buck rabbit will ferve for nine does: fome allow 10 to one buck; but thofe who go beyond this always fuffer for it in their breed.

The wild rabbits are either to be taken by fmall curdogs, or by ipaniels bred up to the fport; and the places of hunting thofe who Itraggle from their burrows, is under clofe hedges or buhtes, or among corn-fields and frelh paltures. The owners ufe to counfe them with fnall grey-hounds; and though they are feldom killed this way, yet they are driven back to their burrows, and are prevented from being a prey to others. The common method is by nets called purfe nets, and ferrets. The ferret is fent into the hole to fetch them out; and the purfenct being fipread over the hole, takes them as they come out. The ferrets' mouths mult be muffled, and then the rabbit gets no harm. For the more cettain taking of them, it may not be improper to pitch up a hay net or tur, at a fmall difance from the burrows that are intended to be hunted : thus very few of the number that are attempted will efcape.

Some who have not ferrets fmoke the rabbits out of their holes with burning brimitone and or piment. This certainly brings them out into the nets: but then it is a very troublefome and offenlive method; and is very detrimental to the place, as no rabbit will for a long time afterwards come near the burrows which have been fumed with thofe Ainking ingredients.

The tefticle of a rabbit is a very good object for examining the ftructure of this part of generation in animals. The whole fubfance of the tefticle in this animal is made up of veffels, which lie round folds in the manner of the fmaller inteftines: but then both ends of each roll meet at their infertion, which feems to be made into the ductus nervofus; and every one of there little rolls is curioufly embroidered with other veffels, which, from their red colour, appear to be arteries and veins. The feveral little rolls lie in ranges, difpofed with an uniformity which is very agreeable to the eye. Every onc of thefe rolls is not a fingle and entire tube, but each confifts of feveral tubes, befide the veins and arteries which embroider it. This is beft diftinguifhed by the cutting one of the rolls tranfverfely, and then examining the cut end with a glafs, which will appear to be made up of the cut and open ends of four, five, or more parallel tubes, which together form the roll, or fingle tube, as it appears to the eye, being all wrapped up in one common and very thin membrane. Thefe are fo tender that they cammot be explicated and viewed. diftinct, as De Graaf tells us thofe of the tefticles of a rat and of fome other animals may. Thefe, however, as well as the others, are only made up of a congeries of vefiels, and the liquors, which are their contents, without any intermediate fubftance, or any thing of that parenchyma which many authors have talked of. The. tefticles of a bull have the greatelt arpearance of a fl.fhy texture of thofe of any known animal ; yet cven thefeafford no particle of parenchyma, or flefh, when examined by glaffes in any fort of preparation, whether boiled, raw, foaked in fpirits, or in whatever other fate.

The.

Rahirius The tefticles of various animals are very variounly compofed, but all in this gencral manner of weffels variouly rolled and folded together: and even the human teflicles
are of the fame fort ; being compofed folely of rolls of velfels, without any intermediate fubhance, be it called by whatever name, but only confilting of veffels and their liquors.

RABIRIUS (C.) : Roman knight, who lent an immenfe fum of money to Pcolemy Aulctes king of Egypr. The monarch afterwards not only refufed to repay him, but even confined him, and endangered his life. Rabisius efcaped from Egypt with dificulty; but at his return to Rome he was accufed by the fenate of having lent money to an African prince for unlawful purpofes. He was ably defended by Cicero, and acquitted with dificulty. -There was a Latin poet of the fame name in the age of Auguftus. He wrote a poem on the victory which the emperor had gained over Antony at Actum. Seneca has compared him to Virgil for elegance and majetty ; but Quintilian is not fo favourable to his poetry. - And there was an archited in the reign of Domitian, called Rabirius. He built a celebrated palace for the emperor, of which the ruins are fill feen at Rome.

RACCOON. See Ursus.
RACE, in general, fignties running with others in order to obtain a prize, either on foot, or by riding on horfeback, in chariots, \&c.

The race was one of the exercifes among the ancient Grecian games, which was performed in a courfe containing : 25 paces; and thofe who contended in there foot-races were frequently clothed in armour. Chariot and horfe races alfo made a part of thefe ancient games.

Races were known in England in very early times. Fitz-Stephen, who wrote in the days of Henry II. mentions the great delight that the citizens of London took in the diverfion. But by his words, it appears not to have been defigned for the purpofes of gaming, but merely to have fprung from a generous emulation of fhowing a fuperior fill in horfemanflip.

Races appear to have been in vogue in the reign of Queen Elizabeth, and to have been carried to fuch excefs at to injure the fortuncs of the nobility. The famous George earl of Cumberland is recorded to have waited more of his eftate than any of his anceftors; and chiefly by his extreme love to horfe-races, tiltings, and other expenfive diverfions. It is probable that the parfimonious queen did not approve of it; for races are not among the diverfions exhibited at Kennelworth by her favourite Leicefter. In the fnllowing reign, were places allotted for the fport : Croydon in the fouth, and Gartenly in Yorkfhire, were celebrated courfes. Camden alfo fars, that in 1607 there were races near York, and the prize was a little golden bell. See Racing.
\(R_{A C E}\), in genealogy, a lineage or extraction continued from father tofon. See Descent.

RACINE (John), of the French academy, treafurer of France in the generality of Moulins, and fecretary to his majelty, was born at Ferre-Milon in 1639. He had a fine genins for the Belles Lettres, and became one of the firtt poets of the age. He produced his Thebaide when but very young; and aftelwards other pieces, which met with great fuccefs, though they appeared when Corneille was in his higheft repu-
tation. In his career, however, he did not fail to meet with all that oppofition which envy and cabal are ever \(\underbrace{\text { Rap }}\) ready to fet up againft a fuperior genius. It was part. ly owing to a chilgrin from this circuniflance that he toos a refolution to quit the theatre forever ; although his genius was till in full vigour, being not more than \(3^{8}\) years of age. Dut he had alfo imbibed in his in. fancy a deep lenfe of religion; and this, though it had been fmothered for a while by his connections with the theatre, and particularly with the famous aftrefs Champ. melie, whom he greatly loved, and by whom he had a fon, now at length broke out, and bore down all before it. In the firlt place, he refolvad not only to write no more plays, but to do a rigorons penance for thofe he had written; and he actually formed a defign of becoming a Carthufian friar. His religious director, however, a good deal wifer than he, advifed him to think more moderately, and to take meafures more fuitable to his character. He put him upon marrying, and fettling in the world : with which propofal this humbleand tractable penitent complied; and immediately took to wife the daughter of a treafurer of France for Amiens, by whom he had feven children.

He had been admitted a member of the French academy in 1673 , in the room of La Mothe le Vayer deceafed; but fpoiled the fpeech he had made upon that occafion by pronouncing it with too much timidits. In 1677, he was nominated with Boileau, with whom he was ever in Arict friend/hip, to write the hiftory of Louis XIV.; and the pubiic expected great things from two writers of their diftinction, but were difappointed. Boileau and Racine, after having for fome time laboured at this work, perceived that it was entirely oppofite to their genius.

He fpent the latter years of his life in compofing a hiftory of the houfe of Port-Royal, the place of his education; which, however, though finely drawn up, as many have afferted, has not been publifhed. Too great fenfibility, fay his friends, but more properly an impotence of fpirit, fhortened the days of this poet.Though he had converfed much with the court, he had not learned the wifdom, which is ufually learned there, of difguifing his real fentiments. Having drawn up a well-reafoned and well-written memorial upon the mifcries of the people, and the means of relieving them, he one day lent it to Madam de Maintenon to read; when the king coming in, and demanding what and whofe it was, commended the zeal of Racine, but difapproved of his meddling with things that did not concern him: and faid with an angry tone, "Becaufe he knows how to make good verfes, does he think he knows every thing ? And would he be a miniter of fate, becaufe he is a great poet?" Thefe words hurt Racine greatly: he conceived dreadful ideas of the king's difpleafure; and his chagrin and fears brought on a fever, of which he died the 22 d of April 1699 .

The king, who was fenfible of his great merit, and: always loved him, fent often to him in his illnefs; and finding after his death that he had more glory than riches, fettled a handiome penfion upon his family.-There is nothing in the French language written with. more wit and elegance than his pieces in profe. Befides his plays, feveral of his letters have been publified;: he alfo wrote fpiritual fongs, epigrams, \&c. Racine's.
works wete printed at Amferdam in 1722, in 2 vols. 12 mo , and the nest year a pompous edition was piintcd in a vols. quarto.

RACING, the riding heats for a plate, or other premium. See Plate. The amulement of horferacing, which is now fo common, was not unknown among the great nations of antiquity, nor wholly unpratifed by our anceltors in Britain, as we have already mentioned in the article Race. In 1599, private matches between gentlemen, who were their own jockies and riders, were very common; and, in the reign of James I. public races were eitablithed at various places, when the difcipline, and mode of preparing the horfes for running, sic. were much the fame as they are now. The molt celebrated races of that time were called bell-courfes, the prize of the conqueror being a bell: hence, perhaps, the phrafe of bearing the bell, when applied to excellence, is derived. In the latter end of Charles I.'s reign, races were performed in Hyde-Park. Newmarket was alfo a place for the fame purpofe, though it was firtt ufed for hunting. Racing was re. vived foon after the Reftoration, and much encouraged by Charles II. who appointed races for his own amufement at Datchet Mead, when he refided at Windfor. Newmarket, however, now became the principal place. The king attended in pertion, eftablifhed a houfe for his own accommodation, and kept and entered horfes in his own name. Infead of bells, he gave a filver bowl or cup value 100 guineas; on which prize the exploits and pedigree of the fucceisful horfe were generally engraved. Inftead of the cup or bowl, the royal gift is now a hundred guineas. William III. not only added to the plates, but even founded an academy for riding; and Queen Anme continued the bounty of her anceitors, adding feveral plates herfelf. George I. towards the end of his reign, difcontinued the plates, and gave in their room a hundred guineas. An act was palled in the 1 th year of the reign of George II. for fup. preffing races by poneys and other imall and weak horfes, \&c. by which all matches for any prize under the value of 501 . are prohibited, under a penalty of 2001. to be paid by the owner of each horfe running, and 1001 . by fuch as advertife the plate; and by which each horfe entered to run, if five years old, is obliged co carry ten fones; if fix, eleven; and if feven, twelve. It is alfo ordained, that no perfon fhall run any horle at a courie, unlefs it be his own, nor enter more than one horfe for the fame plate, upon pain of forfeiting the horfes; and alfo every horfe-race mult be begun and ended in the fame day. Horfes may run for the value of 50 . with any weight, and at any place. 13 Geo. II. cap. 19. 18 Geo. Il. cap. 34. Pennant's Britih Zoology, vol. i. p. 6, \&c. Berenger's Hillory and Art of Horfemanihip, vol. i. p. 185, \&c. At Newmarket there are two courfes, the long and the round : the firft is exactly four miles and about 380 yards, \(i\). e. 7420 yards. The fecond is 6640 yards. Childers, the fwifteft horie ever known, has run the firft courle in feven minutes and a half, and the fecond in fix mi. nutes forty feconds; which is at the rate of more than forty-nine feet in a fecond. But all other horfes take up at leaft feven minutes and fifty feconds in completing the firft and longeft courfe, and feven minutes only in the fhortelt, which is at the rate of more than fortyfeven feet in a fecond. And it is commonly fuppofed
that thefe courfers cover, at every bound, a ípace of Rachit:s, ground in length about twenty-four Englifh feet. Racehorfes have been fur fonie time an object of taxation.

RACHIMIS, the Rigkets. See Medicine, \(n^{\circ} 34 \%\)
RACK (Edmund), a perfon well known in the literary world by his attachment to, and promotion of, agricultural knowledge: he was a native of Norfolk (Lingland), a Quaker. His education was common, and he was apprenticed criginally to a fhopkeeper : his focicty was felect in this fituation, and by improving himfelf in larning, his converfation was enjoyed by a refpectible acquainance. He wrote many effays, poems, and letters, and fome few controverfial tracts. At length he fettled, about his 40 th year, at Bath in 1775 , and was foon introduced to the moft eminent literati of that place, among whom Dr Wilfon and Mrs Macaulay highly efteemed him for his integrity and abilities. In 1777 he publifhed Mentor's Letters, a moral work, which has run through many editions. But this year he gained great celebrity by his plan of an agricultural fociety, which was foon adopted by four counties. He ftill further advanced his fame by his papers in the Far. mer's Magazine, and his communications in the Bath Society's papers; a work remarkable for its ingenuity and fpirit. His laft engagement was in the Hittory of Somerfetihire, where the topographical parochial furveys were his. This work, in 3 vols 4 to, was publifhed in 179 r, by his colleague the Reverend Mr Collinfon. -Mr Rack died of an althma in February 1787 , aged 52 .

Rack, an engine of torture, furnifhed with pulleys, cords, \&c. for extorting confeffion from criminals. The trial by rack is utterly unknown to the law of England; though once, when the dukes of Exeter and Suffolk, and other minifters of Henry VI. had laid a defign to introduce the civil law into Britain as the rule of government; for a beginning thereof they erected a rack for torture, which was called in derifion the duhe of Exeter's daughter, and Itill remains in the 'Tower of London, where it was occafionally ufed as an engine of ftate, not of law, more than once in the reign of Queen Elizabeth. But when, upon the affaffination of Villiers duke of Buckingham, by Felton, it was propofed in the privy council to put the affafin to the rack, in order to difcover his accomplices; the judges, being confulted, declared unanimoully, to their own honour and the honour of the Englifh law, that no duch proceeding was allowable by the laws of England. It feems aftonifhing that this ufage of admini. fering the torture fhould be faid to arife from a tendernefs to the lives of men; and yet this is the reafon given for its introduction in the civil law, and its fub. fequent adoption by the French and other forcign na. tions, viz. becaufe the laws cannot endure that any man fhould die upon the evidence of a falfe, or even a fingle witneis, and therefore contrived this method that innocence fhould manifef itfelf by a fout denial, or guilt by a plain confeflion : thus rating a man's virtne by the hardineis of his confitution, and his guilt by the feníbility of his nerves. The Marquis Beccaria, in an exquifite piece of raillery, has propofed this problem, with a gravity and precifion that are truly mathematical: "The force of the mufcles and the fenfibility of the nerves of an innocent perfon being given; it is required to find the degree of pain necellary to make him

\section*{R A D}
confers himfelf guilty of a given crime." Sce Act of Faith, Inquisition, and Torture.

Rack, a piritnous liquor made by the Tartars of Tongula. This kind of rack is made of mare's milk, which is left to be four, and afterwards diftilled twice or thrice between two earthen pots clofely ftoped ; whence the liquor runs through a dinall wooden pipc. This liquor is more intoxicating than brandy dittilled from wine.

Rack, or Arack. See Arack.
To Rack Wines, Eic. To draw them off from their lces, after having ftood long enough to enb and icttle. Hence rack-vintage is frequently uled for the fecond voyage the wine-merchants ufe to make into France for racked wines.

RACKOON, in zoology, a fpecies of URSUs.
RACONI, a popnlous town of Italy, in Piedmont, feated in a pleafant plain, on the roan from Savillan to Turin, on the rivers Grana and Macra. It belongs to the prince of Carignan, who hats a handfome callle here. It is fix miles from Savillan, and fix from Carignan. E. Long. 7. 46. N. Lat. 4+ 39.

RADCLIFFE (Dr John), an Englifh phyfician of great eminence in his time, b in at Wakefield in Yorkfhire in 1650. He was educated at Oxford, and enrolled himfelf upon the phyfical line; but it was reinarkable that he recomniended himfelf more by his ready wit and vivacity, than by any extraordinary acquifitions in learming. He began to practice at Oxford in 1675 ; but never paid any regard to eftablithed roles, which he cenfured whenever le thought fit, with great freedom and acrimony; and as this drew all the old practitioners upon him, he lived in a continual tate of hoftility with them. Neverthelefs, his reputation increafed with his experience; fo that, before he had been tivo years in bulinefs, his practice was very extenfive among perfons of high rank. In \(168_{4}\) he removed to London, and fettled in Bow-Atreet, Covent Garden, where in lefs than a year he got intu prime bufinefs.In 1687 the princels Anne of Denmark made him her phyfician : yet when her hufband and fhe joined the prince of Orange, Radcliffe, either not chooling to declare himfelf, or unwilling to favour the meafures then in agitation, exculed himfelf from attending them, on the plea of tha multitude of his patients. Neverthelefs, he was often fent for to King William and other great perfonages, though he did not incline to be a courtier. He incurred fome cenfure for his treatment of Q. Mary, who died of the fmall-pox; and foon after lof his place about the princefs Anne, by his attachment to his bottle. He alfo totally loft the favour of K . William by his uncourtly freedom; for, in 1680 , when the king fhowed him his fwollen ancles, while the reft of his body was emaciated, and afked him what he thourght of them? "Why truly I would not have your majelty's two legs for your three kingdoms," replied Radcliffe. He continued increafing in bufinefs and infolence as long as he lived, continually at war with his brethren the phyficians; who confidered him in no other light than that of an active ingenious empiric, whom conftant practice had at length brought to fome degree of thill in his profeflion. He died in 1714 ; and if he never attempted to write any thing himfelf, has perpetuated his memory by founding a fine library at Oxford, to preferve the writings of other men.

RADIALIS, the name of two mutcles in the nim. Rariulis Sce Anatomy, Table of the Mufics.

RADIANT, in optics, is any point of a vifible ob- Raff. ject from whence rays proced.

RADIATED flowers, in botany, are fuch as have feveral femiflofules fet round a dilk, in forns of a radiant far ; thofe which have no fuch rays are called difoous flowers.

RADIA'TION, the act of a body emitting or diffuling rays of light all round as from a centre.

RADICAL, in general, fomething that ferves as a batis or foundation. Hence phyticians talk mucli of a radical moilture. In grammar, we give the appeliation radical to primitives, in contradiftinction to compounds and derivatives. Algebraits alfo fpeak of the radical fign of quantitics, which is the character expreffing their roots.

RADICLE, that part of the feeds of all plarts which upon vegetating becomes their root, and is difcoverable by the microfcope. See Plant.

RADISH, in botany, See Raphavus.
KADIUS, in geometrs, the femidiameter of a circle, or a right line drawn from the centre to the circumicrence.

In trigonometry, the radius is termed the whole finc, or fine of \(90^{\circ}\). See Sine.

Radius, in anatomy, the exterior bone of the arm, defcending along with the ulna from the elbow to the writt.

RADNOR, the county-town of Radnorfhire, in South Wales. It is a poor little place, diftant frons London about 150 miles. It is fituated near the fipringhead of the river Somergil, in a fruitful valley at the bottom of a hill, where there are fheep grazing in abundance. It is a very ancient borough-town, whofe juriddiction extends near 12 miles round about : the government of it is vefted in a bailiff and 25 burgeffes. Though it is the county-town, the afizes are held at Prefteign : it has one privilege, however, that is very extraordinary, befides that of fending one member to parliament ; and that is, it keeps a court of pleas for all actions, without being limited to any particular fum. It was formerly fenced with a wall and a ftrong caltie; but both were in a great meafure demolifhed by Owen Glendower, when he affumed the title of Prince of Wales, upon the depofition of King Richard II. W. Long. 2.45. N. Lat. 52. 10.

RADNURSHIRE, a county of South Wales, is bounded on the north by Montgomeryfhire ; on the eaft by Shropfhire and Herefordfhire ; on the fouth and fouch-welt by Brecknockfhire; and on the weft by Cardiganhire ; extending 30 miles in length and 25 in breadth. This county is divided into fix hundreds, in which are contained three market-towns, 52 parifhes, about 3160 houfes, and 18,960 inhabitants. It is feated in the dioceie of Hereford, and fends two members to parliament, one for the county and one for the town of Radnor. The air of this county is in winter cold and piercing. The foil in general is but indifferent; yet fome places produce corn, particularly the ealtern and fouthern parts; but in the northern and weftern, which are mountaineus, the land is chiefly focked with horned cattle, fineep, and goats.

RADIX. See Roor.
\(\mathrm{RAFT}_{2}\) a fort of float, formed by an affemblage of

\section*{R A G \\ R A J}
varions planks or pieces of timber, faftened together fide by fide, fo as to be conveyed more commodioully to any fhort diftance in a harbour or road than if they were feparate. The timber and plank with which merchant-fhips are laden, in the different parts of the Dailtic Sea, are attached together in this manner, in order to flat them off to the thipping.

RAFTERS, in building, are pieces of timber which, flanding by pairs on the reafon or railing piece, meet in an angle at the top, and form the roof of a building. See Arcintecture.

Rowley RAGG, a genus of Atones, belonging to the filiceous clafs. It is of a dufky or datk grey colour, with many fmall thining cryftals, having a granular texture, and acquiring an ochry cruft by expolure to the air. The fpecific gravity is 2748 . It becomes magnctic by being heated in an open firc. In a flrong fire it melts without addition, but with more difficulty than bafaltes. It was analyfed by Dr Withering, who found that roo parts of it contain 47.5 of filiceous earth, 32.5 of argil, and 20 of iron.

RAGMAN's roll, Rectivs Ragimund's roll, fo ealled from one Ragimund a legate in Scotland, who calling before him all the beneficed clergymen in that kingdom, caufed them on oath to give in the the true value of their benefices; according to which they were afterwards taxed by the court of Rome; and this roll, among other records, being taken from the Scots by Edward I. was re-delivered to them in the beginning of the reign of Edward III.

RAGOUT, or Ragoo, a fauce, or feafoning, intended to roufe the appetite when loit or languifhing.

This term is alfo ufed for any high-feafoned difh prepared of flefh, fifh, greens, or the like : by fewing them with bacon, falt, pepper, cloves, and the like ingredients. We have ragouts of celery, of endive, arparagus, cock's combs, giblets, craw-filh, Eic.

The ancients had a ragout called garum, made of the putrified guts of a certain filh kept till it difflved into a mere fanies, which was thought fuch a dainty, that, according to Pliny, its price equalled that of the richeft perfumes.

RAGSTONE, a genus of fones belonging to the claf's of tiliceous earths. It is of a grey colour; the texture obicurely laminar, or rather fibrous; but the laminx or fibres confift of a congeries of grains of a quartzy appearance, coarfe and rough. The feccific gravity is 2729 ; it effervefces with acids, and frikes fire with Ateel. Mr Kirwan found it to contain a portion of mild calareous earth, and a fmall proportion of iron. It is ufed as a whettone for coarfe cutting tools. It is found about Newcaflle, and many other parts of Eagland, where there are largerocks of it in the hills.

RAGULED; or Ragged, in heraldry, jagged or knotted. This term is applied to a crr fs formed of the trunks of two trecs without their branches, of which they thow only the flumps. Raguled differs from indented, in that the latter is regular, the former not.

RAGUSA, an ancient town of Sicily, in the Val-di-Noto, near the river Maulo, 12 miles north of Modica. E. Long. 14. 59. N. Lat. 37. o.

Ragusa, a city of Dalmatid, and capital of Ragufen. It is about two miles in circumference, is pretty well built, and frong by fituation, having :m inaccelfible mountain on the land-fide, and on the fide of the
fea a ftrong fort. It has an archbifhop's fee and a republic, and has a doge like that of Venice, but he continues a month only in his ofice. It carries on a confiderable trade with the Turks, and is 68 mics northweft of Scutari, and 110 north of Brindifi. E. Long 18. 10. N. Lat. 42.50.

RAGUSEN, a territory of Europe in Dalmatia, lying along the coatt of the gulph of Venice, about 55 miles in length, and 20 in breadth. It is a republic under the protection of the Turks and Venetians. Kagufa is the capital town.

R \(\backslash J\) A, the title of the Indian black princes, the remains of thofe who ruled there before the Moguls. Some of the rajas are faid to preferve their independency, efpecially in the mountainous parts; but moll of them pay an annual tribute to the Mogul. The Indians call them rai; the Perfians, raian, in the plural; and our travellers rajas, or ragias.

Raja, the Ray-Fijh, in ichthyology; a genus belonging to the order of Chondropterygia. There are five fpiracula below towards the peak; the body comprefled; and the mouth is fituated under the head. The moft remarkable fpecies are,
r. The batis, or fkate: this fpecies is the thinneft in proportion to its bulk of any of the genus, and alfo the larget, fome weighing near 200 pounds. The nofe, though not long, is fharp pointed; above the eyes is a fet of fhort ipines: the upper part is of a pale brown, fometimes ftreaked with black: the lower part is white, marked with great numbers of minute black fpots. The jaws are covered with fmall granulated but fharp-pointed teeth. The tail is of a moderate length : near the end are two fins: along the top of it is onc row of fpines, and on the edges are irregularly difperfed a few others, which makes us imagine with Mr Ray, that in this refpect thefe finh vary, fome having one, others more orders of fines on the tail. It is remarked, that in the males of this fpecies the fins are full of fpines. Skates generate in March and April; at which time they fivim near the furface of the water, feveral of the males purfuing one female. They adhere fo faft together in coition, tbat the filhermen frequently draw up both together, though only one has taken the bait. The females begin to caft their purfer, as the fifhermen call them (the bags in which the young are included) in May, and continue doing it till September. In October they are exceedingly poor and thin; but in November they begin to improve, and grow gradually better till May, when they are in the highelt perfection. The males go fooner out of feafon than the females.
2. The oxyrinchus, or fharp.nofed ray, in length near feven feet, and breadth five feet two inches; when juft brought on thore it makes a remarkable fnorting noife. The nofe is very long, narrow, and fharp-pointed, not unlike the end of a foontoon. The body is fmooth, and very thin in proportion to the fize; the upper part alh-coloured, fpotted with numerous white fpots, and a few black ones. The tail is thick; towards the end are two fmall fins ; on each fide is a row of fmall fpines, with another row in the middle, which runs fome way up the back. The lower part of the fift is quite white. The mouth is very large, and furnifhed with numbers of fmall, fharp teeth bending inwards. This fin has been fuppofed.to be the bos of the an-
cients;
cients; which was certainly fome enormous fpecies of ray, though we cannot pretend to determine the particular kind. Oppian ftyles it, the broalefl amons'ffles : he adds an account of its fondnefs ot human fich, and the method it takes of deltroying men, by over-laying and keeping them down by its valt weight till they are drowned. Phile (De proprict. anim. p. 85.) gives much the fame relation. We are inclined to give them credit, fince : m modern witer, of undoubted autholity \({ }^{*}\), gives the very fame account of a fill found in the South Seas, the terror of thofe employed in the pearlithery. It is a fpecies of ray, called there manfa, or the quilt, from its furrounding and wrapping rip the unhappy divers till they are fuffocated ; therefore the negroes never go down withont a tharp knife to defend themfelves againtt the affaults of this terrible enemy.
3. The arpera, or rough ray, is found in LochBroom in Sentland. The length from the nofe to the tip of the tail is two feet nine. The tail is almoft of the fame length with the body. The nofe is very floort. Before each eye is a large hooked foine; and belind each another, befet with leffer. 'I'he upper part of the body is of a cinercous brown mixed with white, and folted with black; and entirely covered with fmall fipines. On the tail are three rows of great fpines: all the rell of the tail is irregularly befet with lelfer. The fins and under fide of the body are equally rough with the upper. The teeth are flat and rhomboidal.
4. The fullonica, or fuller, derives its Latin name from the inftrument fullers make ufe of in fmoothing cloth, the back being rough and finey. The nofe is fhort and fharp. At the corner of each eye are a few fpines. The membrane of nistitation is fringed. Teeth fmall and fharp. On the upper part of the pectoral fins are three rows of fpines pointing towards the back, crooked like thofe on a fuller's inftrument. On the tail are three rows of Arong fpines : the middle row reaches up part of the back. The tail is flender, and rather longer than the body. The colour of the upper part of the body is cinereons, marked ufually with numerous black fpots: the lower part is white. This, as well as moft other fpecies of rays, vary a little in colour, according to age. This grows to a fize eqnal to the fkate. It is common at Scarborough, where it is called the zwhite bans, or gullet.
5. The flagreen ray increafes to the fize of the fkate ; is fond of lannces or fand-eels, which it takes generally as a bait. The form is narrower than that of the common kinds ; the nofe long and very fharp; pupil of the eye fappliarine; on the nofe are two fhort rows of \(\int\) pines; on the corner of the eyes another of a femicircular torm; on the tail are two rows, continued a little up the back, fmall, flender, and very flatp: along the fides of the tail is a row of minute fpines, intermixed with innumerable little fpicnla. The upper part of the body is of a cinerecus brown, covered clofely with thagreen-like subercles, refembling the thin of the dog-fifh: the under fide of the body is white; from the nofe to the beginning of the peetoral fins is a luberculated fpace. The teeth flender, and flarp as needles.

6 The torpedo, cramp-fifh, or electric ray, is frequently taken in l'orbay: has been once caught off Pembroke, and fometimes near Waterford in Ircland. It is generally taken, like other flat fifl, with the trawl; but there is an inflance of its taking the bait. It comVoz, XV.
monly lies in water of about 40 fathom, deptli ; 11: 1 in company with the conconerous brings forth its young at the autumnal equinoox, as at:firned by Aritutie. A gentleman of Lat Rochelle, on dillieting certain females of this fpecies, the \(100 l_{1}\) of September, found in the matrices feve: al of the fretu'es quite formed, and nine eggs in no fate of forwirdnefs: fuperfoctation feems therefore to be a properity of this fith. The food of the torpedo is fith; a farmullet and a platio have been found in the fomach of two of them. 'The furmullet is a filh of that fwitnefs, that it was impollible for the torpedo to take it by purfinit. It is probabl:, therefore, that by their clectric ftroke they fupify their prey ; yet the crab and fea leech will venture to annoy them. They will hive \(2+\) hours out of the fea ; and but very little longer if placed in freth water. Thes inha. bit fandy places; and will bury themfelves fuper ficially in it, by flinging the fand nver, by a quick flapping of all the extremities. It is in this fituation that the torpedo gives his molt f. rcible thock, which throw:s down the aftonifhed paifenger who inadvertently treads upon him. In thefe feas it grow's to a great fize, and above 80 pounds weight. The tail is thick and round; the csudal fin broad and abrupt. The head and body. which are indifinct, are nearly round ; attenuating io extreme thinnefs on the edges; below the body, the ventral fins form on each fide a quarter of a circle. The two dorfal fins are plated on a trumk of the tail. The eyes are fmall, placed near each other : behind each is a round fpiracle, with fix fmall cutaneous rags on their inner circumference. Mouth fmall ; teeth minute, fpicular. Five openings to the gills, as in others of this genus. The fkin everywhere fmooth; cincreous brown above, white bencath. Sce further the article Electricity, \(n^{\circ}\) 258-261.
7. The clavata, or thornback, is eafily difhinguifhed from the others by the rows of frong tharp ipines difpofed along the back and tail. In a large one feen by Mr Pennant, were three rows on the back, and five on the tail, all inclining towards its end. On the nofe, and on the inner lide of the forehead, near the ejes, were a few fpines, and others were feattered wihhout any order on the upper part of the pectoral fins. The mouth was fmall, and filled with granulated teeth: The upper part of the body was of a pale afh colour, marked with fhort ftreaks of black, and the ikin rough, with fmall tubercles like fhagreen. The belly white, crofled with a ftrong femilunar cartlage beneath the fkin : in general, the lower part was fmooth, having only a few finines on each fide. The young filh have very few fpines on them; and their backs are often fpotted with white, and each f10t is encircled with black. This fpecies frequents the fandy fhores; are very voracious, and feed on all forts of flat fifl; are particularly fond of herrings and fand-eels; and fometimes eat cruftaccous animals, fuch as crabs. Thefe fometimes weigh 14 or 15 pounds, but with feldom exceed that weight. They begin to generate in June, and bring forth their young in July and Augult, which (as well as thofe of the Ikate) before they are old enough to breed, are called naids. The thornback begins to be in feafon in November, and contimues fo later than the thate, but the young of both are good at all times of the year.
8. The paftinaca, or fing ray, does not grow to the bulk of the others: The body is quite fmooth, of flape almoft round, and is of a much greater thichnefs and

\footnotetext{
5 F more
}

\section*{RAI [ 778 ] R A I}
more elevated form in the middle than any other ways, but grows thin towards the edges. The nofe is very flarp pointed, but fhort; the mouth fmall, and filled with granulated teeth. The irides are of a gold colour : behind each eye the otifice is very large. The tail is very thick at the beginning: the fpine is placed about a thind the length of the former from the body ; is about five inches long, flat on the tup and bottom, very hard, thap puinted, and the two fides thin, and clofely :Ind harply bearded the whole way. The tail extends four inclies beyond the end of this fpine, and grows very flender it the extremity. Thefe fifh are obferved to thed their fpines, and renew them annually; fometimes the ncw fpine appears before the old one drops off; and the Cornilh call this facies carlinal trilof, or three-tailed, when fo circumflanced. The colour of the upper part of the body is a dirty yellow, the middle part of an obfeure blue : the lower fide white, the tail aid fpine duf. ky. The weapon with which nature has armed this fith, hath fupplied the ancients with many tremendous fables relating to it. Pliny, Flian, and Oppian, have given it a venom that affects even the inanimate creation : trees that are fruck by it inftantly lofe their vcruure and perihh, and rocks themfelves are incapable of refifting the potent poifon. The enclantrefs Circe armed her fon with a fpear headed with the fpine of the trygon, as the moft irrefiftible weapon the could furnifh him with; and with which he afterwards committed particide, unintentionally, on his father Ulyfies. That fpears and darts might, in very early times, have been headed with this bone intead of iron, we have no kind of doubt; that of another fpecies of this filh being fill ufed to point the arrows of fome of the South American Indians, and is, from its hardnefs, fharpnefs, and beards, a molt dreadful weapon. But in refpect to its venomous qualities, there is not the leaft credit to be given to the opinion, though it was believed (as far as it affected the animal world) by Rondeletius, Aldrovand, and others, and even to this day by the fifhermen in feveral parts of the world. It is in fact the weapon of offence belonging to the fifh, capable of giving a very bad wound, and which is attended with dangerous fymptoms when it falls on a tendinous part or on a perfon in a bad habit of body. As to any filh having a fpine charged with actual poifon, it feems very dubious, though the report is fanctified by the name of Limnxus. He inftances the pafisaca, the torpedo, and the tetrodon lincatus. The firft is incapable of conveying a greater injury than what refults from the mere wound; the fecond, from its eleatric efluvia; and the third, by imparting a pungent pain like the Ating of nettles, occalioned by the minute fipines on its abdomen.

RAIANIA, in botany: A genus of the hexandria order, belonging to the dioecia chats of plants; and in the natural method ranking under the ith order, \(S a-\) mentaces. The male calyx is fexpartite; there is no corolla. The female calyx as in the male, without any corolla; there are three Ayles ; the fruit is roundifh with an oblique wing, inferior. There are three fyecies, the haftata, cordata, and quinqucfolia.

RAIETEA, one of the South Sea iflands, named aloo Ulietea.

RAIL, in ornithology. See Rallus.
Rill LE. Y , according to Dr Johnfon, means fight fatie, or fatirical nerriment : and a benutiful wri. tor of the latt century compares it to a light which
dazzles, and which does not blirn. It is fometimes in. nocent and pleafant, and it fhould always be fo, but it is moft frequently offenive. Raillery is of various kinds; therc is a ferious, fevere, and good-humoured raillery ; and there is a kind which perplexes, a kind which offends, and a kind which pleafes.

To rally well, it is abfolutely neceflary that kindnefs run through all you fay ; and you mult ever preferse the cliardeter of a friend to fupport your pretentions to be free with a man. Allufions to paft follies, hints to revive what a man has a mind to forget for ever, fhould never be introduced as the fubjects of raillery. This is not to thruft with the fkill of fencers, but to cut with the barbarity of butchers. But it is below the character of men of humanity and good-breeding to be capable of mirth, while there is any in the company in pain and diforder.

RAIN, the defcent of water from the atmofphere in the form of drops of a confiderable fize. By this circumftance it is diftinguifhed from dew and fog: in the former of which the drops are fo fmall that they are quite invifible ; and in the latter, though their fize is larger, they feem to have very little more fpecific gravity than the atmofphere itfelf, and may therefore be reckoned hollow fpherules rather than drops.

It is univerfally agreed, that rain is produced by the water previouly abforbed by the heat of the fiun, or otherwife, from the terraqueous globe, into the atmofphere; but very great difficulties occur when we begin to explain why the water, once fo clofely united widh the atmofphere, begins to feparate from it. We camot afcribe this feparation to cold, fince rain often takes place in very warm weather; and though we fhould fuppofe the condenfation owing to the filperior culd of the higher regions, yet there is a remarkable fact which will not allow us to have recourfe to this fuppofition. It is certain that the drops of rain increale in fize confiderably as they defcend. On the top of a hill, for infance, they will be fmall and inconfiderable, forming only a drizzling fhower; but at the bottom of the fame hill the drops will be exceflively large, defcending in an impetuous rain; which thows that the atmofplere is difpofed to condenfe the vapours, and afually does fo, as well where it is warm as where it is cold.

For fome time the fuppofitions concerning the caufe of rain were exceedingly infufficient and unfatisfactory. It was imagined, that when various congerics of clouds were driven together by the agitation of the winds, they mixed, and run into one body, by which means they were condenfed into water. The coldnefs of the upper parts of the air alfo was thought to be a great means of collesting and condenfing the clouds into water; which, being heavier than the air, mult neceffarily fall down through it in the form of rain. The reafon wllyy it falls in drops, and not in large quantities, was faid to be the refiftance of the air ; whereby being broken, and divided into fmaller and fmaller parts, it at laft arrives io us in fmall drops. But this laypothefis is entircly contrary to almolt all the phenomena: for the weather, when coldef, that is, in the time (f fevere froft, is generally the moft ferene; the moft violent rains alfo happen where there is little or mo cold to condenfe the clouds; and the drops of rain, inftead of being divided into fmaller and fmaller ones as they approach the earth, are plainly increared in fize as they defcend.

\section*{R A I}

Dr Derham accounted for the precipitation of the drops of rain from the veficule being full of air, and meeting with an air colder than they contained, the air they contained was of conlequence contracted into a fmadler pace ; and confequently the watery flell rendered thicker, and thus fpecifically heavier, than the common atmofphere. Wut it has been fhown, that the veficux, if finch they are, of vapour, are not filled with air, but with fire, or heat; and confequently, till they part with this latent heat, the vapour can-
Sce Che- not be condenfed \(\rho\). Now, cold is not always fuflicient to effect this, lince in the moft fevere frofts the air is very often ferene, and parts with little or none of its va- pour for a very conliderable time. Neither can we admit the winds to have any confiderable agency in this matter, fince we find that blowing upon vapour is fo far from condenfing it, that it mites it more clofely with the air, and wind is found to be a great promoter of evapordtion.

According to Rohault, the great caufe of rain is the heat of the air; which, after continuing for fome time near the earth, is raited on high by a wind, and there thawing the fnowy villi or flocks of half-frozen veficulx, reduces them to drops; which, coalefcing, defcend. Here, however, we ought to be informed by what means thefe veliculx are lulpended in their halffrozen ftate; fince the thawing of them can make but litite diflerence in their fpecific gravity, and it is certain that they afcended through the air not in a frozen but in an aqueous itate.

Dr Clarke and others alcribe this defcent of the rain rather to an alteration of the atmofphere than of the veficulx; and fuppofe it to arife from a diminution of the elaftic forec of the air. This elafticity, which, they fay, depends chiefly or wholly upon terrene exhalations, being weakened, the atmofphere finks under its burden, and the clouds fall. Now, the little velicles being once upon the defeent, will continue therein, notwithitanding the increafe of refiftance they every moment meet with. For, as they all tend to the centre of the earth, the farther they fall, the more coalitions they will make; and the more coalitions, the more matter will there be under the fame fur. face; the furface increafing only as the fquares, but the folidity as the cubes; and the more matter under the fame furface, the lefs refiftance will there be to the fame matter. Thus, if the cold, wind, Sc. act early enough to precipitate the afcending veficles before they are arived at any confiderable height, the coalitions being but few, the drops will be proportionahly imall; and thus is formed a dew. If the vapours be more copious, and rife a little higher, we have a mift or fog. A little higher nill, and they produce a fmall rain; if they neither meet with cold nor wind, they form a heavy thick dark tky. This hypothefis is equally unfatisfactory with the others; for, granting that the detent and condenfation of the vapours are owing to a diminution of the ammof phere's elafticity, by what is this diminution occafioned? To fay that it is owing to terrene exhalations, is only folving one difficulty by another; fince we ate totally unaçuainted both with the nature and operation of thefe exhalations. Defides, let us fuppofe the caufe to be what it will, if it ads equally and at once upon all the vapour in the air, then all that vapour muf be precipitated at once ; and thus,
inftead of gentle flowers continuing for a confiderabic
Rais. length of time, we flould have the noft vident waterfpouts, coatinuing only for a few minutes, or perlaps feconds, which, inticad of refrething the earth, would drown and lay wafte every thing beture them.

Since philofophers have admitted the elearic flaid to fuch : large thare in the operations of nature, almoft all the natural phenomena have been accounted for by the action of that fluid; and rain, among others, has been reckoned an effect of eleatricity. But this word, unlefs it is explained, makes us no wifer thar: we were before; the plenomena of artificial eleatricity having been explained on principles which could fearee apply in any degree to the clectricity of nature: and therefore all the folution we can obtilin of the natural appearances of which we fpeak, comes to this, that rain is oceafioned hy a moderate eledrification, hail and fnow by one more violent, and thunder by the moll violent of all ; but in what manner this eleerrification is oceafioned, hath not yet been explained. Throughout the various parts of this work where electricity hath been occalionally mentioned, the principles of artificial electricity \(\|\), laid down in the treatife appropriated to that i| See lisesfubjea, have been applicd to the folution of the pheno. tricity, no mena of nature ; thofe which are neceflary to be attend. 201, 216, ed to here are the following:
1. The elearic fluid and folar light are the fame fubtance in two different modifications.
2. Electricity is the motion of the fluid when running, or attempting to run, in a continued fream from one place to anolher : heat is when the fluid has no tendency but to vibrate outwards and inwards co and fron: a centre; or at leaft when its ftreams converge to a point or focus.
3. The fluid acting as eleOricity, like water, or any other fluid, always tends to the place where there is leaft refiftance.

On thefe three principles may the phenomena of atmofpherical electricity, and the defeent of rain by its means, be explained as follows :
I. The light or heat of the fun, acting in that peculiar manner which we call heat, unites itfelf with the moilture of the earth, and forms it into vapour, which thus becomes fpecifically lighter than air, and of confequence afcends in the atmofplere to a certain height.
2. Befides the quantity of light which is thus united to the water, and forms it into vapour, a very confiderable quantity enters the earth, where it ailumes the nature of electric Huid.
3. As the earth is always full of that fluid, every quantity which enters muft difplace an equal quantity which is already there.
4. 'This quantity which is difplaced muft efcape either at a diflance from the place where the other enters, or very near it.
5. At whatever place a quantity of elearic matter efeapes, it mult eleftify the air above that place where it has efcaped; and as a confiderable quantity of light mult always be reflected from the earch into the atmofphere, where it dees not combine with the aqueous vapour, we have thence another fuluce of electricity to the air; as this quantity mult undoubtedly affume the action of elcetric fluid, eljecially after the astion of the fun has ceafed. Hence the rea-

\section*{R A I}
kin. fon why in firene weather the atmofpherical eleatricity is always itrongen, and rather more fo in the night than in the day.
6. From thefe confiderations, we fee an evident reafon why there mult commonly be a difference between the elestricity of the c.rrth and that of the atmofphere, excepling when an carthquake is about to enfue. The confequence of this mult be, that as the ation of the folar light eontinues to bring down the dearic matter, and ihe earth continues to difcharge an equal quantity of it into the atrnofphere, fome part of the atmofphere mult at laft become overloaded with it, and atiempt to throw it back into the earth. This a t. mpt will be vain, until a vent is found for the electricity at fome cther place; and as foon as this happens, the electrified atmorphere begins to throw off its luperfluous electricity, and the earth to receive it. As the atmofhere itfelf is a bad conducter, and the more fo the drier it is, the electric matter attacks the fmall aquecus particles which are detained in it by means of the latent heat. Thefe being unable to bear the impetus of the fluid, throw out their latent heat, which eafily cfrapes, and thus makes a kind of vacuum in the electified part of the atmorphere. The confequences of this are, that the aqueous particles being driven together in large quantity, at laft become vifible, and the fly is covered with clouds; at the fame time a wind blows againt thefe clouds, and, if there is no refiftarce in the atmodphere, will drive them away.
7. But if the atmofphere all round the cloud is exceedingly electrified, and the earth is in no condition to receive the fuperfluous fluid excepting in that place which is direatly under the cloud, then the whole electricity of the atmofphere for a valt way round will tend to that part only, and the cloud will be electrified to an extreme degree. A wind will now blow againft the cloud from all quarters, more and more of the vapour will be extricated from the air by the electric matter, and the cloud will become darker and thicker, at the fame time that it is in a manner ftationary, as being acted upon by oppolite winds; though its fize is enlarged with great rapidity by the continnal fupplies of vapour brought by the winds.
8. The vapours which were formerly fufpended inviibly by means of the latent heat are now fufpended vifibly by the electric fluid, which will not let them fall to the earth, until it is in a condition to receive the electric matter defcending with the rain.It is eafy to fec, however, that thus every thing is prepared tor a violent form of thunder and lightning as well as rain. The furface of the earth becomes electrified from the atmof phere : but when this has coninucd for fome time, a zone of earth confiderably below the furface acquires an elefricity oppofite to that of the clouds and atmofphere; of confequence the electricity in the cloud being violently prefied on all fides, will at lat burft out towards that zone where the refiftance is leaft, as explained under the article Lichtning. - The vaponrs now having lof that which fupported them, will fall down in rain, if there is not a fufficient quantity of electric matter to keep them in the fame ftate in which they were before: but if this happens to be the cafe, the cloud will inftantly be charged again, while little or no rain will fall; and heuse very violent thunder fometimes takes place with-
out any rain at all, or fuch as is quite inconfiderable in quantity.
9 . When the electricity is lefs violent, the rain will defecnd in valt quantity, efpecially after every flafh of lightning; and great quantities of electric matter will thus be conveyed to the earth, infomuch that fometimes the drops have been obferved to thine as if they were on fire, which has given occation to the reports of fiery rain having fallen on certain occafions. If the quantity of electric matter is fmaller, fo that the rain can convey it all gradually to the ground, there will be rain without any thunder; and the greater the quancity of electricity the more violent will be the rain.

From this account of the caufes of rain, we may fee the reafon why in warm climates the rains are exceffive, and for the moft part accompanied with thunder; for there the electricity of the atmofphere is immenfely greater than it is in cold. We may alfo fee why in certain places, according to the fituation of mountains, feas, \&cc. the rains will be greater than in others, and likewife why fome parts of the world are exempted from rain altogether; but as a particular difcuftion of thefe would neceffarily include an explanation of the caufes and phenomena of Thunder, we flall for this reafon refer the whole to be treated of under that article.

Whether this theory be juft, however, it would be ten affuming in us to fay. It may admitot difpute, for we muft grant that in the very befl fyftems, though an occurrence fo frequent, the theory of rain is but very imperfectly underftood. Dr James Hutton, Fellow of the Royal Society of Edinburgh, whofe fpeculations are always ingenious, though generally extraordinary, and mucl out of the common way, gives us a new theory of rain in the firft volume of the Tranfactions of that fociety. It is well known that atmolpheric air is capable of diffolving, with a certain degree of heat, a given quantity of water. The Doctor afcertains the ratio of the diffolving power of air, in relation to water, in different degrees of heat; and fhows, that by mising a portion of tranfparent humid warm air with a portion of cold air, the mixture becomes opake, and part of the water will be precipitated; or, in other words, the vapour will be condenfed into rain. The ratio which he Atates, however, does not appear to us to be fupported by experience. Whether the electricity of the air changes in confequence of its depoliting the water diffolved in it, or the change is a caufe of this depofition, muft remain uncertain; but, in either view, there muft be an agent different from heat and cold, fince the changes in thefe refpects do not in other operations change the fate of electricity. Dr Hutton fuppofes that heat and folution do not increafe by equal increments; but that, in reality, if heat be fuppofed to increafe by equal increments along a fraight line, folution will be exprefled by ordinates to a curve whofe convex fide is turned towards that line. That the power of folution is not increafed in the fame ratio with heat, is, however, hypothetical, except when we rife pretty high in the fcale, when its proportional increafe is a little doubtful : and it is not, in this paper, fupported by experiment. The condenfation of the breath in air is not an obfervation in point, except in air already faturated with vapour. It can amount, in any view, to no more than this, that to render it vifible, the heat muft be dio minifled

\section*{R I \(\quad[73 \mathrm{r}] \quad \mathrm{R}\) AI} minihed in a grater propostion than can be compen- mation of clouds and rain. If it is not in the immefated by the power of folution in the body of air, in which the portion expired is at firft immerfed. To es.. plain rain from this caule, we mut always fuppofe a confant diminution of leat to take place at the moment of the condenfation of the vapour ; but we adually find that the change from a flate of vapoar to the fluid fate is attended with heat ; fo that rain mutt at once oppofe its own caule, and continned rains would be inmpollible, without calling in the aid of other canles. From his own fyflem, Dr. Hutton endeavours to explain the regular and irregular feafons of rain, either refpeting the gencality of its appearance, or the regularity of its return. And to obviate the apparent exceptions of the theory, from the generality of rain, he explains the proportional quantities of tain, and adds a comparative eftinate of climates, in relation to rain, with the meteorological obfervations made in our own climate. As his principle is at leaf infufficient, and we think erroneous, it would be ufelefs, even were this a proper place for it, to purfue thefe various branches, which muft partake of the errors of the fy\{tem. In thefe branches we ought to obferve, that there are feveral juft obfervations, mixed with errors, becaufe evaporation and condenfation muft at laft be the great bafis of every theory : the miftakes arife from not being aware of all the caufes, and milieprefenting the operiation of thofe which do exif.

In a work entitled Thoughts on Meteorology, Volume II. M. de Luc confiders very particularly the grand phenomenon of rain, and the numerous circumftances connected with it. He examines the feveral hypothefis with confiderable care ; but thinks them, even if admifible, utterly infuficient to account for the formation of rain. The grand quellion in this inquiry is, What becomes of the water that rifes in vapour into the atmofphere? or what fate it fubfilts in there, between the time of its evaporation and its falling down again in rain? If it continues in the Gate of watery vapour, or fuch as is the immediate product of evaporation, it mult polfels the diftinctive characters effential to that fluid: it muft make the hygrometer move towards humidity, in proportion as the vapour is more or lefs abundant in the air : on a diminution of heat, the humidity, as thewn by the hygrometer, mut increafe; and on an increafe of the heat the humidity muft diminifh; and the introduction of other hygrofcopic fubfances, drier than the air, mult have the fame effeet as an augmentation of heat. Thefe are the properties of watery vapour, on every hypothefis of evaporation; and therefore all the water that exilts in the atmofphere without poffeffing thefe properties, is no longer vapour, but mult have changed its nature. M. de Luc flows, that the water which forms rain, though it has ever been conlidered and reafoned upon as producing humidity, does not poffefs thefe properties, and mult therefore have paffed into another flate. See a full account of his reafoning, and the Iteps by which he proceeded, in the article Meteorology, \(n^{\circ} 7\), \&ic. As he thinls that the vapour paffes into an invifible fate in the interval between evaporation and its falling again in rain, and that in that flate it is not fenfible to the hygrometer, he confiders the laws of hygrology as infufficient for explaining the formation of rain; but he does not pretend to have difcovered the immediate caufe of the for-
mation of clouds and rain. If it is nnt in the immeif the vapours change their nature in the atmofphere, to as no lonrer to be fenfible to the hygrometer, or to the eye; if they do mot become vapour again till clouds appear ; and if, when the clouds are formed, no alter:tion is perceived in the quality of the air-we mult acknowledge it to be very probable, that the intermedinte flate of vapour is no other than air-and that the clouds do not proceed from any dilitinet fluid contained in the atmofphere, but from a decomponition of a part of the air itfelf, perfealy limilar to the relt.

It appears, to us at leart, that M. de Luc's mode of reafoning on this fulject agrees better with the phenomena than Dr Hutton's. The Doctor, however, thinks differently, and publifhed anfwers to the objections of M. de L.uc with regard to his theory of rain; to which M. de Luc replied in a letter which was printed in the Appendix to the 81ft volume of the Monchly Review : but it would extend onr article beyond its due bounds, to give a view of this controverfy. See Vapour, TVater, Weather, and Wind.

As to the general quantity of rain that falls, and its proportion in feveral places at the fame time, and in the fame place at feveral times, we have many obfervatims, journals, \&c. in the Memoirs of the French Academy, the Philofophical Tranfactions, \&c. Upon meafuring, then, the rain falling yearly, its depth, at a medium, and its proportion in feveral places, is found as in the following table : Inches.
At Townley, in Lancalhire, cbferved by Mr

Rain.
Proportion of the Rain of the feveral Seafons to one another.

See Plilofophical Tranfactions abridged, vol. iv. p. ii p. 8 t , \&c. and alfo Meteorological Journal of the Royal Society, publifhed annually tn the Philofophical Tranfastions.

As to the ufe of rain, we may obferve, that it moiftens and foftens the earth, and thus fits it for affording nourifhment to plants ; by falling on high mountains, it carries down with it many particles of loofe earth, which ferve to fertilize the furrounding valleys, and purifies the air from noxious cxlalations, which tend in their return to the earth to meliorate the foil; it moderates the he:it of the air ; and is one means of fupplying fountains and rivers. However, vehement rains in many countries are found to be attended with barrennefs and poornets of the lands, and mifcarriage of the crops in the fucceeding year : and the reafon is plain; for there excelfive ftorms wafh away the fine mould into the rivers, which carry it into the fea, and it is a long time before the land recovers itfelf again. The remedy to the famine, which fome countries are fubjeat to from this fort of mifchief, is the planting large orchards and groves of fuch trees as bear efculeat fruit; for it is an old obfervation, that in years, when grain fucceeds worf, thefe trees produce moft fruit of all. It may partly be owing to the thorough moiftening of the earth, as deep as their roots go by thefe rains, and partly to their trunks ftopping part of light mould carried down by the rains, and by this means furnifhing themfelves with a coat of new earth.

Preternatural Rasns. We have numerous accounts, in the hiftorians of our own as well as other countries, of preternatural rains; fuch as the raining of fones, of duft, of blood, nay, and of living animals, as young frogs, and the like. We are not to doubt the truth of what thofe who are authors of veracity and credit relate to us of this kind, fo far as to fuppofe that the falling of ftones and duft never happened; the whole mittake is, the fupporing them to have fallen from the clouds: but as to the blood and frogs, it is very certain that they never fell at all, but the opinion has been at mere deception of the eyes. Men are extremely foind of the marvellous in their relations; but the judicions reader is to examine ftrialy whatever is reported of this kind, and is not to fuffer himiclf to te deceived.
There are two natural methods by which quantities of fones and duft may tall in certain places, without their having been generated in the clouds or fallen as rain. The one is by means of hurricanes: the wind which we frequently fee tearing off the tiles of houfes, and carying them to confiderable diftances, being equally able to take up a quantity of fones, and drop them again at fome other place. But the other, which is much
the mon powerful, and probably the molt ufual way, is for the eruptions of volcanoes and burning mountains to tofs up, as they frequently do, a vaft quantity of fones, alhes, and cinders, to an immenfe height in the air: and thefe, being hurried away by the hurricanes and impetuous winds which ufually accompany thofe eruptions, and being in themfelves much lighter than common fones, as being half calcined, may ealily be thos carried to vaft diftances; and there falling in places where the inlabitants know nothing of the occafion, they cannot but be fuppoled by the vulgar to fall on them from the clonds. It is well known, that, in the great cruptions of Rtna and Vefuvius, fhowers of afhes, dult, and fmall cinders, have been feen to obfcure the air, and overfpread the furface of the fea for a great way, and cover the decks of thips; and this at fuch a diftance, as it fhould appear fcarce conceivable that they fhould have been carried to: and probably, if the accounts of all the howers of thefe fubflances mentioned by authors be collected, they will all be found to have fallen within fuch difances of volcanoes; and if compared as to the time of their falling, will be found to correfpond in that allo whth the eruptions of thofe mountains. We have known inftances of the a fhes from Vefuvius having been carried thirty, nay, lorty leagues, and peculiar accidents may have carried them yet farther. It is not to be fuppofed that thefe fhowers of ftones and dult fall for a continuance in the manner of flowers of rain, or that the fragments or pieces are as frequent as drops of water; it is fufficient that a number of flones, or a quantity of duff, fall at once on a place, where the inhabitants can have no knowledge of the patt from whence they came, and the vulgar will not doubt their dropping from the clouds. Nay, in the canton of Berne in Swifferland, the inhabitants accounied it a miracle that it rained earth and fulphur upon them at a time that a fmall volcano terrified them; and even while the wind was fo boiflerous, and hurricanes fo frequent, that they faw almoft every moment the duft, fand, and little Itones torn up from the furface of the carth in whirlwinds, and carried to a confiderable height in the air, they never confidered that both the fulphur thrown up hy the volcano, and the dult, \&c. carried from their feet muft fall foon after fomewhere. It is very certain that in fome of the terrible Itorms of large hail, wherc the hail-fones have been of many incles round, on breaking them there have been found what people have called fones in their middle; but thefe obfervers needed only to have waited the difolving of one of thefe hail-ftoncs, to have feen the fone in its centre difunite alf, it being only formed of the particles of loofe earthy matter, which the water, exhaled by the fun's heat, had taken up in extremely fnall mole. culx with it ; and this only having ferved to give an op.se hue to the inner part of the congelation, to which the freezing of the water alone gave the apparent hardnefs of llone.

The raining of Llood has been ever accounted a more terrible fight and a more fatal omen than the other preternatural rains already mentioned. It is very certain that nature forms hlood nowhere but in the veflels of animals; and therefore flowers of it from the clouds are by no means to be credited. Thofe who fuppofe that what has been taken for blood has been actually feen falling through the air, have lad recourle to flying infects for its origin, and fuppofe it the eggs or dung of
certalif

\section*{K A I \\ [ 783 ]}

Rain. certain butterflies difcharged from them as they were high up in the air. But it feems a very wild conjecture, as we know of no buttertly whofe c.screments or eggs are of fuch a colunt, or whote abode is to high, or their flocks fo mumerous, as to be the occation of this.

It is moft probable that thefe bloody waters were never feen falling; but that people feeing the ftand ng waters blood-enloured, were allured, trom their not knowing how it thould elfe happen, that it had rained blood into then. A very memorable inflance of this there was at the Hague in the year 1670. Swammerdam, who relates it, tells us, that one morning the whole town was in an uproar on finding their lakes and ditclies full of blood, as they thought; and having been certainly full of water the night before, they agreed it mult have rained blood in the night : but a certain phyfician went down to one of the canals, and taking home a quantity of this blood coloured water, he examined it by the microfeope, and found that the water was watier ftill, and had not at all changed its colour; but that it was full of prodigious twarms of fmall red animals, all alive, and very nimble in their motions, whofe cwlour and prodigious number gave a red tinge to the whole body of the water they lived in, on a lel's accurate in. fpection. The certainty that this was the cale, did not however perfuade the Hullandets in part with the miracle: they prudently conclu led, that the fudden ap. pearance of fuch a number of anumals w.as as great a prodigy as the raining of ilood would have been; and are alliured to this day, that this portent foretold the fene of war and deftruction which Louis XIV. aficrwards brought into that cunatry; which had before enjoyed to years unimierrupted peace.

The animals which thas colour the water of lakes and ponds are the puilics aritrefecnies of Swammerdam, or the water-fleas with brinchel horns. Theere ercatures are of a reddifh-yellow or Hame colour: they live about the fides of ditches, under weeds, ard araong the mud; and are therefore the lels vifitle, except at a certain time, which is in the end or begiming of June : it is at this time that thefe little animals leave their recelfes to float loofe above the water, to mect for the propagation of their fpecies, and by that means become vifible in the colour they give the water. This is vifible, more or lefs, in one pait or other of almoft all fanding wa. ters at this feafon; and it is always at this featon that the bloody waters have alarmed the ignorant. See \(P^{C} C\) leex Monoculus.

The raining of frogs is a thing not lefs wonderful in the accounts of authors who love the marvellous, than thofe of blood or ftones; and this is fupp fed to happen fo often, that there are multitudes who pretend to have been eye.witnefles of it. Thefe rains of frogs always happen after very dry feafons, and are much more frequent in the hotter countrics thin in the cold ones. In Italy they are very frequent; and it is not uncommon to fee the freets of Reme fwarming both with young frogs and toads in an inflant in a thower ci rain they hopping everywhere between the people's legs as they walk, though thete was not the leaft appearance of them before. Nay, they hwe been feen to fall through the air down upon the pavements. This feems a fleong circunit:ance in favour of their being rained down from the clonds; but, when ftrietly cxamined, it comes to nothing: for thefe frogs that are feen to fall, are always
found dead, lamed, or bruifed by the fall, and never hop about as the relt; and theyare never feen to fall, excep: clofe under the walls of houtes, from the roofs and gruter of which they have accidentally llpped down. Some people, who luve io add to Arange things yet ftranger. athirm that they have had the young frogs fall into their hats in the midll of :in open fiedd; but this is idle, and wholly falfe.
Others, who camnot agree to their falling from the clouds, have tried to folve the dificulty of th:ir findden appearance, by fuppofing them hatched out of the egg, or fpawn, by thele rains. Nay, fome have fuppofed them made immediately out of the dult: but there are unanfwerable arguments agraint all thefe fuppolitions. Equivocal generation, or the fpontaneous production of animals out of duft, is now wholly exploded. The fall from the clouds muft deftroy and kill thefe tender and Loft-bodied animals: and they cannot be at this time hatched imme iiately out of eggs ; beeaufe the yong frog does not make its appearance from the egg in form, but has its hinder legs enveloped in a flin, and is what we call a tudpole; and the young frogs are at leait 100 times larger at the time of their appearance, than the egg from which they thould be hatched.

It is beyond at doubt, that the frogs which make their appearance at this time, were hatehed and in being long before : but that the dry feafons had injured them, and kept them fluggifhly in holes or coverts; and that all the rain does, is the enlivening them, giving them new fpirits, and calling them forth to leek new habitations, and enjoy the element they were deflined in great part to live in. Theophbraftus, the greateft of all the naturalifts of antiquity, has affirmed the fame thing. We find that the error of fuppoling theie creatures to fall from the clouds was as early as that author's time ; and alfo that the truth, in regard to their appearance, was as early known; though, in the ages fince, authors have taken care to conceal the truth, and to hand down to us the error. We find this venerable fage, in a fragnent of his on the generation of animals which appear on a fudden, bantering the opinion, and afferting that they were hatched and living long before. The world owes, however, to the accurate Signior Redi the great proof of this truth, which Theophraltus only has affirmed : for this gentleman, diffecting fome of thefe new-appeating frogs, found in their fomachs herbs and other half-digellcd food; and, openly fhowing this to his credulons countrymen, aked them whether they thougit that nature, which engendered, according to their opinion, thefe animals in the clouds, had alfo been fo provident as to engender grats there for their food and nourithment?

To the raining of frogs we ought to add the raining of grafshippers and locilfs, which have fometimes appeared in prodigious numbers, and devoured the fruits of the earth. There has not heen the leaft pretence for the fuppofing that thefe animals defcended from the clonds, but that they appeared on a fudden in prodigious numbers. The natur, litt, who knows the many accidents attending the egrss of thefe and other the like animals, cannot but know that fome featons will prove particulaty favourable to the hatching them, and the prodigius number of eags that many infects lay could not but every year bring us fuch abundance of the young, were they not liable to many accidents, and had net provident nature taken care, as in many plats, to continue

\section*{R A I [784] K A I}
perhaps not one in 500 need take root in order to continue an equal number of plants. As it is thus alfo in regard to inlects, it cannot but happer, that if a fayourable featon encourage the hatching of all thofe eggs, a very fmall number of which alone were neceflary to continue the fecies, we muft, in fuch featons, have a proportionate abundance of them. Where appeared : bout 50 years ago, in London, fuch a prodigious fwarm of the little beetle we call the laty-corv, that the very potts in the threets weaceverywhere covered with them. But thanks to the progrefs of philofophy among us, we lad no body to affert that it rained eow ladies, but contented ourlelves with fising that it had been a favourable feafon for their egrgs. The prodigious number of a fort of grub which did valt milchief about the fume period among the corn and grafs by eating off their roots, might allo have been fuppofed to proceed from its having rained grubs by people fond of making every thing a prodigy ; but our knowlelge in natural hiltory aflured us, that thefe were only the hexapode worms of the common hedge-beetle called the cock-chafer.

The raining of fibbes has been a prodigy alfo much talked of in France, where the ftreets of a town at fome difance from Paris, after a terrible hurricane in the night, which tore up trees, blew down houfes, \&x. were found in a mamer covered with fithes of varions fizes. Nobody here made any doubt of thefe having fallen from the clouds; nor did the abfurdity of fifh, of five or fix inches long, being generated in the air, at all fartle the people, or thake their belief in the miracle, till they found, upon inquiry, that a very well-focked filh-pond, which food or an eminence in the ncighbourhood, had been blown dry by the hurricane, and only the great fifh left at the bottom of it, all the fmaller fry laving been tofled into their ftreets.

Upon the whole, all the fuppofed marvellous rains have been owing to fubftances naturally produced on the carth, and cither never having been in the air at all, or only carried thither by accident.

In Silefla, after a great dearth of wheat in that country, there happened a violent ftorm of wind and rain, and the earth was afterwards covered, in many places, with fmall round feeds. The vulgar cried out that Providence had fent them food, and that it had rained millet: but thefe were, in reality, only the feeds of a fpecies of veronica, or fpeed-well, very common in that country; and whofe feeds being juft ripe at that time, the wind had dillodged them from their capfules, and fattered them about. In Britain, we have hitorics of rains of this mavellous kind, but all fabulous. It was once faid to rain quheat in Wilthire ; and the people were all alarmed at it as a miracle, till Mr Cole thowed them, that what they took for wheat was only the feeds or kernels of the berifes of ivy, which being then fully ripe, the wind had diflodged from the lides of houfes, and trunks of trees, on which the ivy that produced them crept.

And we even once had a raining of filhes near the coalt of Kent in a terrible hurricane, with thunder and lightning. The people who faw fmall furats frewed all about afterwards, would have it that they had fallen fiom the clonds; but thofe who confidered how far the high winds have been known to carry the fea-water, did
not wonder that they fhould be able to earry fmall fifh with it for fmall a part of the way.

In the Philofopheal Tranfactions for \({ }_{17} \mathrm{~S}_{2}\) we have the following account of a preternatural kind of rain by Count de Gioeni: "The morning of the 24 th inftant there appeared here a moft lingular phenomenon. Every place expoled to the air was found wet with a colonred cretaceous grey water, which, after evaporating and filtrating away, left every place covered with it to the height of two or thrce linse ; and all the ironwork that was touched by it became rufty.
"The public, inclined to the marvellous, fancied various caufes of the rain, and began to fear for the animals and vegetables.
"In places where rain-water was ufed, they abfained from it: fome fulpecting vituiolic principles to be mised with it, and others predicting fome epidemical diforder.
"Thofe who had obferved the explofions of Etna 20 days and more before, were inclined to believe it originated from one of them.
"The thower cxtended from N. \(\frac{3}{4}\) N. E. to S. \(\frac{1}{4}\) S.W. over the fields, about 70 miles in a right line from the vertex of Etna.
"There is nothing new in volcanos having thrown up fand, and alfo tones, by the violent expanfive force generated within them, which land las been carried by the wind to dileant regions.
"But the colour and fulatility of the matter occafioned doubts concerning its origin; which increafed from the remarkable circumitance of the water in which it came incorporated; for which reafons fome other principle or origin was inspected.
"It became, therefore, neceffary by all means to afcertain the nature of dis matter, in order to be convinced of its origin, and of the effects it might produce. This could not be done without the help of a chemical analyfis. To do this then with certainty, I endeavoured to collect this rain from places where it was moft probable no heterogeneons matter would be mixed with it. I therefore chofe the plant called braffica capitata, which having large and turned-up leaves, they contained enough of this coloured water: many of thefe I emftied into a veffel, and lett the contents to fettle till the water became clear.
" This being feparated into another veflel, I tried it with vegetable alkaline liquors and mineral acids; but could obferve no decompolition by either. I then evaporated the water in order to reunite the fubtances that might be in folution; and touching it again with the aforefaid liquors, it fhowed a llight effervefcence with the acids. When tried with the fyrup of violets, this became a pale green ; fo that I was perfuaded it contained a calcarcous falt. With the decoction of galls no precipitation was produced.
"The matter being afterwards dried in the fhaóe, it appeared a very fubtile fine earth, of a cretaceous colour, but inert, from having been diluted by the rain.
"I next thought of calciaing it with a flow fire, and it affumed the colour of a brick. A portion of this being put into a crucibie, I applied to it a fronger heat; by v:hich it lolt almolt all its acquired colour. Again, I expoled a portion of this for a longer time to a very viulent heat (from which a vitrification might be
expected) ;

Rain, expected) ; it remained, however, quite foft, and was Kainbow. cafily bruifed, but returned to its original duky colour.
"From the mof accurate obfervations of the fmoke from the three calcinations, I could not difcover either colour or fmell that indicated any arfenical or fulphureous mixture.
" Having therefore calcined this matter in three portions, with three different degrees of fire, I prefented al good magnet to cach: it did not att either on the firt or fecond; a flight attraction was vifible in many places on the third: this perfiuaded me, that this earth contains a martial principle in a metallic form, and not in a vitriolic fubtance.
"The nature of thefe fubftances then being difcovered, their volcanic origin appears; for iron, the more it is expofed to violent calcination, the more it is divided by the lofs of its phlogittic principle; which cannot naturally happen but in the great chimney of a volcano. Calcareous falt, being a marine falt combined with a calcareous fubtance by means of violent heat, cannot be otherwife compofed than in a volcano.
"As to their dreaded effects on animals and vegetables, every one knows the advantageous ufe, in medicine, both of the one and the other, and this in the fame form as they are thus prepared in the great laboratory of nature.
"Vegetables, even in flower, do not appear in the leaft macerated, which has formerly happened from only fhowers of fand.
"How this volcanic production came to be mixed with water may be conceived in various ways.
" Etna, about its middle regions, is grenerally furrounded with clouds that do not always rife above its fummit, which is 2900 paces above the level of the fea. This matter being thrown out, and defcending upon the clouds below it, may happen to mix and fall in rain with them in the ufual way. It may alfo be conjectured, that the thick fmoke which the volcanic matter contained might, by its rarefaction, be carried in the atmofphere by the winds over that tract of country; and then cooling fo as to condenfe and become feecifically heavier than the air, might defcend in that coloured rain.
"I muft, however, leave to philofophers (to whom the knowledge of natural agents belongs) the examination and explanation of fuch phenomena, confining myfelf to obfervation and chemical experiments."
\(R_{\triangle 1 N}\), a well built and fortified town of Bavaria, one of the keys of this eleCorate, on the Lech, 20 miles weft of Ingolitadt. N. Lat. 48. 5i. E. Long. II. \(\$ 2\).

Rain-Bird. See Cuculus, \(\mathrm{n}^{\circ} 8\).
Rainbow. See Optics, Part II. Sect. i. if 1.
In the Philofophical Tranfactions for 1793, we have the following account of two rainbows feen by the Rev. Mr Sturges.
"On the evening of the 9 th of July 1792 , between feven and eight o'clock, at Alverftoke, near Gofport, on the fea-coaft of Hampfhire, there came up, in the fouth-eaft, a clond with a thunder-fhower; while the fun thone bright, low in the horizon to the northweft.
Plate "In this fhower two primary rainbows appeared, ececxxvit. \(A B\) and \(A C\), not concentric, but touching each other fig. 2. Voz. XV.
at \(A\), in the fouth part of the horizon; with a fecrin- Reisinne. dary bow to cach, DEF and DF (the laft very faint but difcernible), which touched likewife at D. Both thic primary were very vivid for a confilerable time, and at different times nearly equally fo; but the bow Ali was moft permanent, was a larger fegment of a circle, and at laft, after the other had vanifhed, became almoft a femicircle; the fun being near fetting. It was a perfećt calm, and the fea was as fmoot!' as glafs.
" If I might venture to offer a folution of this ap. pearance, it would be as follow:. I confider the bow \(A B\) as the true one, produced by the fun itfelf; and the other, AC, as produced by the reflection of the fur from the fea, which, in its perfectly fmooth flate, afted as a feectilum. The diredion of the iea, between the Ine of Wight and the land, was to the north-weft in : line with the fun, as it was then fituated. The image refected from the water, having its rays iffuing from a point lower than the real fun, and in a line comings from beneath the horizon, would coniequently form a bow higher than the true one AB . And the thores, by which that narrow part of the fea is bounded, would before the fun's actual fetting intercept its rays from the furface of the water, and caufe the bow AC, which I fuppofe to be produced by the reflection, to difappear before the other."

The marine or fea bow is a phenomenon which may be frequently obferved in a much agitated fea, and is occafioned by the wind fweeping part of the waves, and carrying them aloft; which when they fall down are refracted by the fun's rajs, which paint the colours of the bow juft as in a common fhower. Thefe bows are often feen when a veffel is failing with confiderable force, and dafhing the waves around ber, which are raifed partly by the action of the flip and piatly by the force of the wind, and, falling down, they form : rainbow; and they are alfo often occalioned by the dafting of the waves againtt the rocks on fhore.

In the Philofophical Tranfactions, it is obferved by F. Bourzes, that the colours of the marine rainbow are lefs lively, lefs diftinct, and of ihorter continuance, than thofe of the common bow; that there are fearce above two colours diftinguithable, a dark yellow on the fide next the fun, and a palc green on the oppofite fide. But they are more numerous, there being fometimes 20 or 30 feen together.
To this clafs of bows may be referred a kind of white or colourlefs rainbows, which Mentzelius and others af. firm to have feen at noon-day. M. Marlotte, in his four Effai de Pbyfique, fays, thefe bows are formed in mits, as the others are in fhowers; and adds, that he has feen feveral both after fun-rifing and in the night. The want of colour he attributes to the fmallnefs of the vapours which compofe the mift; but perhaps it is rather from the exceeding tenuity of the little veliculx of the vapour, which being only little watery pellicles bloated with air, the rays of light undergo but little refraction in paffing out of air into them; too little to feparate the differently coloured rays, \&ic. Hence the rays are reflected from them, compounded as they came, that is, white. Rohanlt mentions * colourcd rainhows on the grafs; formed by the refractions of the fun's rays in the morning dew. Rainbows have been alfo produced by the reflection of the fun from a river; and in the Philofophical Tranfactions, Vol. L. p. 29.4. we 5 G . have

Trait. de Phyfique.

\section*{R A I \\ R A I}

Raintew. have an account of a rainbow, which mult have been the time, accompanied with a drizzling rain. It is a Rainhow, formed by the exbalations from the city of London, when the fun had been fet 20 minutes, and confequently the centic of the bow was above the horizon. The culours were the fame as in the common rainbow, but fainter.

It hat often been made a fubject of inquiry among the cunious how there cane to be no rainbow before the flood, which is thought by fome to have been the cafe from its being made a fign of the covenant which the Deity was pleafed to make with man after that event. Mr Whitelinft, in his In?uiry into the Original State and Formataon of the Ear:h, p. 173, \&e. endeavours to eltablifl it as a matter of great probability at leat, that the antediluvian atmonfere was fo uniformly temperate as never to be fubject to forms, tempelts, or rain, and of courfe it could never exlibit a rainbow. For nur own part, we cannot fee how the eanh at that period conld do without rain any more thats at prefent ; and it appears to us from Scripture equally probable that the rainbow was fien before the flood as after it. It was then, however, made a token of a certain covenant; and it would unquetlinnably do equally well for that purpofe if it had exilted before as if it had not.

Lunar Rancoow. The moon fometimes alfo exbibits the phenomenon of an iris or rainbow by the refraction of her rays in drops of rain in the night-time. This phenomenon is very rare. In the Philofophical Tranfactions for 1783 , however, we have an account of three feen in one year, and all in the fame place, communicated in two letters by Marmaduke Tunitall, Efq. The firlt was feen 27 th February 1782 , at Greta Bridge, Yorkfhire, between feven and eight at night, and appeared "in tolerably diftinet colours, fimilar to a folar one, but more faint : the orange colour feemed to predominate. It happened at full moon; at which time alone they are faid to lave been always feen. Though Ariftote is faid to have obferved two, and fome others have been feen by Suellius, \&c. I can only find two defcribed with any accuracy; viz. one by Plot, in his Hittory of Oxforthire, feen by him in 1675, though without colours; the other feen by a Derbyhhire gentleman at Glapwell, near Chefter field, defcribed by Thorefly, and inferted in \(\mathrm{N}^{\circ} 331\). of the Philofophical Tranfnations: this was about Chrittmas, 1710 , and faid to have had all the colours of the Iris Solaris. The night was windy ; and though there was then a drizzling rain and dark cloud, in which the rainbow was reflected, it proved afterwards a light froft."

Two others were afterwards feen by Mr Tunftall ; one on July the 3 oth, about it o'clock, which latted about a quarter of an hour, without colours. The other, which appeared on Friday OEtober 18. was "perhaps the moft extraordinary one of the kind ever feen. It was firf vifible about nine o'clock, and con' inued, tho' with very different degrees of brilliancy, till patt two. At firt, thungh a Arongly marked bow, it was without colours; but afterwards they were very confpicuous and vivid in the fame form as in the folar, though fainter ; the red, green, and purple, were molt dilinguithable. About twelve it was the moft fplendid in appearance ; its arc was confiderably a fmaller fegment of a circle than a folar ; its fuuth-eaf limb firft began to fail, and a confiderable time before its final extinction: the wind was very high, nearly due weft, moft part of
finguiar circumlance, that three of thefe phenomena thould have been feen in fo fort a time in one place, as they have been efteemed ever fince the time of Arillotle, who is faid to have been the finft obferver of them, and faw only two in 50 years, and fince by Plot and Thorefby, almont the only two Englith authors who have fpoken of them, \(t_{0}\) be exceeding rare. They feem evidently to be occationed by a reftaction in a cloud or turbid atmofphere, and in general are indications of ftormy and rainy weather: fo bad a feafon as the late fummer having, I believe, feldom occurred in England. 'Thoretby, indeed, fays, the one he obferved was fucceeded by feveral days of fine ferene weather. One particular, rather firgular, in the fecond, viz. of July the 30 th, was its being fix days alter the full of the moon; and the latt, though of to long a duration, wa; three days before the full: that of the 27th of Febru. ary was exactly at the full, which ufed to be judged the only time they could be feen, though in the Encyclopedia there is an account that Weidler obferved one in 1719, in the firt yuarter of the moon, with faint colours, and in very calm weather. No lunar iris, I ever heard or read of, latted near to long as that on the 18 th intant, either with or without colours."

In the Gentleman's Magazine for Auguit 1788 we have an account of a lunar rainbow by a correfpondent who faw it. "On Sunday evening the 17 th of Augult (fays he), after two days, on both of which, particulariy the former, there had been a great deal of rain, together with lightning and thunder, juft as the clock's were flriking nine, 23 hours after full moon, looking through my window, I was ftruck with the appearance of fomething in the fky, which feemed like a rainbow. Having never feen a rainbow by night, I thought it a very extraordinary phenomenon, and haItened to a place where there were no buildings to obftruct my view of the hemifphere : here I found that the phenomenon was no other than a lunar rainbow; the moon was truly 'walking in brightne \(f\) s,' brilliant as the could be; not a cloud was to be feen near her ; and over-againft her, toward the north-weft, or perhaps rather more to the north, was a rainbow, a valt arch, perfect in all its parts, not interrupted or broken as rainbows frequently are, but unremittedly vifible from one horizon to the other. In order to give fome idea of its extent, it is neceflary to fay, that as I ftood toward the weftern extremity of the parifh of Stoke Newington, it feemed to take its rife from the welt of Hampltead, and to the end, perhaps, in the river Lea, the eaftern boundary of Tottenham; its colour was white, cloudy, or greyifl, but a part of its weftern leg feemed to exhibit tints of a faint ficlly green. I continued viewing it for fome time, till it began to rain ; and at length the rain increaling, and the fky growing more hazy, I returned home about a quarter or 20 mi nutes palt nine, and in ten minutes came out again ; but by that time all was over, the monn was darkened by cluuds, and the rainbow of courfe vaniflied."

Marine Rainbow, or Sealow. See the article Rainbow.

RAINBow-Stone. See Moon-Stone.
RAISINS, grapes prepared by fuffering them to remain on the vine till they are perfectly ripe, and then drying them in the fun, or by the heat of an oven.

Rainn The difference betwecn raifins dried in ti.c fun, and fiveet and pleafant, but the later have a batent acidity with the tweenel's that renders them much lefs agrec-
able.
The common way of drying g:apes for railims, is to tie two or thince bunches of them togecher while yet on the vine, and dip tham into a hot lixivium of woodathes, with a little of the vil of olives in it. 'This difpoles them to fluink and wrinkle; and after this they are lefi on the vine three or tour days feparated on tlicks in an horizontal fituation, and then dried in the fun at leifure, after being cut from the tree. The innelt and belt raifins are thole called in fome places Lamafcus ard Yube raikins; which are dhltuguithed from the others by their fize and figure: they ate flat and wrinkled on the furface, loft and juicy within, and near an inch long; and, when frell and growing on the bunch, are of the fize and ilnupe of a large olise.
The raifins of the finn, and jar-raitins, are all dried by the heat of the fun; and thefe are the forts ufed in medicine. However, all the kinds have much the fame virtues: they are all mutritive and ballamic ; they are allowed to be attenuant, are faid to be good in nephritic complaints, and are an ingredient in pectoral decoctions : in which cafes, as alio in all others where altringency is not required of them, they fhould have the itones carefully taken out.

Ratsin. Wine. See Wine.
RAKKATH (anc. geog.), a town of Upper Galilee, thought to be Tiberias, (Talmud): but this is denied by Reland, who fays that Rakkath was a town of the tribe of Napthali.

RAKE is a well known infrument with teeth, by which the ground is divided. See Agriculture, p. 318 .

Rake alio means a loofe, diforderly, vicious, and thoughtefs fellow.

RAKR of a Sbip, is all that part of her hull which hangs over both ends of her keel. That which is before is called the fore rake, or rake forsoard, and that part which is at the fetting on of the fern-poft is called the rake.aft, or aftervuard.

RALEIGH (Sir Walter), fourth fon of Walter Ra'eigh, Efq; of Fardel, in the parifh of Cornwood in Deronfhire, was born in 1552 at Hayes, in the parilh of Budley, a farm belonging to his father. About the year 1568, he was fent to Oriel college in Oxford, where he continued but a flort time; for in the following year he embarked for France, being one of the hundred volunteers, commanded by Henry Champernon, who, with other Englilh troops, were fent by queen Elizabeth to adift the queen of Notarre in defending the Proteftants. In this fervice he continued for five or fix years; after which he returned to London, and probatly refided in the Middle Temple. But his enterprifing genius would not fuffer him to remain long in a ttate of ina Sivity. In 1577 or 1578 , he embarked for the Low Countries with the troops fent by the queen to allift the Dutch againft the Spaniards, and probably fhared the glory of the decifive viftory over Don John of Auftria in 1578 . On his return to England, a new enterprife engaged his attention. His half-brother, Sir Humphrey Gilbert, having obtained a patent to plant and inhabit fome parts of North Ame-
rica, Nir Raleigh embarked in hais adrenture; Lá, K ! : \(\quad\).
 they returned, without fuccels, in 1579.
'Ilde following your, the king of bpain, in col ju:c. tion with the lope, having projefod a tot.l ca:pocel of the Lnglith domiaions, Lent troops to Ircland to ai fitt the Definonds in the Munfer icbelli \(n\). Raleigh obtaned at captain's cumnaillion under Lord Grey of Wilton, thens deputy of Ireland, and enabaked for that kinglom; where, by his conduct and refolution, he wats proncipally intrumental in putting an end to the rebul. lous attempt. He ruturned to Lingland; and attratt. ed the notice of gucen Elizabeth, owing, as we are told in Naunton's Fragmertu Regalia, to the following accidental picce of gallantry. The quecn, as the was one day taking a walk, being fopped by a jplafly plate in the road, our gallant young foldier took oft his new plufh mantle, and fpread it on the ground. Her m:tjefty trod gently over the fair foot-cloth, furprifed and pleafed with the adventure. He was a handiome man, and remarkable for his gentility of addrefs.

The queen admitted him to her court, and employed him firft as an attendant on the French amballador Stmier on his return home, and afterward to efcort the auke of Anjou to Antwerp. During this excurfion he became perionally known to the prince of Orange; from whom, at his return, he brought fpecial acknonledgments to the queen, who now frequently converfed with him. But the inactive life of a courtier did a:ot fuit the enterprifing fpirit of Mr Raleigh. In the year 1583, he embarked with his brother, Sir Humphrey Gilbert, on a fecond expedition to Newfoundland, in a hhip called the Raleigh, which he built at his own expence; but was obliged to return on account of an infectious diftemper on board. He was, however, fo little affected by this difappointment, that he now laid before the queen and council a propofal for exploring the continent of North America; and in 158 qobtained a patent empowering him to poffefs fuch countries as he fhould difcover in that part of the globe. Accordingly Mr Raleigh fitted out two lhips at his own expence, which failed in the month of April, and returned to England about the midatle of September, reporting that they had difcovered and taken polleffion of a fine country called Windargocoa, to which the queen gave the name of Virginia. About this time he was elected knight of the thire for the county of Devon, and foon after received the honour of knighthood; and to enable him to carry on his defigns abroad, the queen granted him a patent for licenling the renders of wine throughout the kingdom. In 1585 he fent a Heet of feven thips to Virginia, commanded by his relation Sir Richard Grenville, wholeft a colony at Roanah of 107 perf \(n s\), under the government of Mr I.ane; and by the eftablifhment of this colony he firt imported tobaccointo England. See Nicotiana. In the tame year Sir Wal. ter Raleigh obtained a grant of 12,000 acres of the forfeited lands in the county of Cork in Ireland.About the fame time he was made fenefchal of the duchy of Cornwall, and warden of the fanneries; and grew into fuch favour with the queen, that even Leicefter was jealous of his influence.

In 1587 , he fent another colony of 150 men to Virginia, with a governor, Mr Joln White, and 12 allittants. About this time we find our knight diftinguifh.

Raleiyh. ed by the titles of Captrinn of the queen's guards, and Lieutenant general of Cornvuall. From this period to the year 1594 , he was continually cargaged in projecting new expeclitions, fending fuccours to colonies abroad, defending the kinguom from the infults of the Spaniards, and tranfacting purliamentary, bulinefs, with equal ability and refulution. Whillt thus employed, he was publicly charged, in a libel written by the infamous J-suir Parfons, with being an Atheitt; a groundlefs and ridiculous imputation. In 1594, he obtained from the queen a grant of the manor of Sherborne in Dorfethire, where he built a magnificent houle: but Sir Walter fell under the queen's difpleatire on account of an intrigue with the daughter of Sir Nicholas Throgmorton, one of the maids of honour ; however, he married the lady, and lived with her in great conjugal harmony. During his difgrace at court, he projected the conquelt of Guiana in South America, and in 1595 failed for that country; of which having taken policilion, after defeating the Spaniards who were fettled there, he returned to England the fame year, and fron after publifhed an account of his expedition. In the following year he was one of the admirals in the fuccefsful expedition againft Cadiz, under the command of Howard and the earl of Elfex; and in 1597 he failed with the fame commanders againft the Azores. Soon after thefe expeditions, we find him affiduoully engaged in parliamentary bufinefs, and a diftinguifhed perionage in joufts and tournaments. In 1 Goo he was fent on a joint embalfy with Lord Cobham to Flanders, and at his return made governor of Jerfey.

Queen Elifabeth died in the beginning of the year 1603; and with her Raleigh's glory and felicity funk, never to rife again. Upon the accefion of James, Sir Walter lof his intereft at court, was ftripped of his preferments, and accufed of a plot agaisft the king. He was arraigued at Winchefter, and, on his trial, infulted by the moft fhocking brutality by the famous Coke, attorney-general, whofe fophiftical vociferation influenced the jury to convict him without the leaft proof of guilt. After a month's imprifonment, however, in daily expectation of his execution, he was reprieved, and fent to the Tower ; and his eftates were given to Car, earl of Somerfet, the king's favourite. During this confinement, he wrote many of his moft valuable pieces, particularly his Hiftory of the World. In March 1615, after 16 years imprifonment, he obtained his liberty, and immediarely legan to prepare for another voyage to Guiana. In Augult 1616, the king granted hima very ample commiffion for that purpofe; and in July the yeir following, he failed from Plymouth : but, Atrange as it may appear, it is moft certain that the whole cheme was revealed to the Spaniards by the king himfelf, and thus neceilarily rendered abortive.

He returned to England in 1618, where he was foon after feized, imptifoned, and beheaded; not for any prerended mifdemeanor on the late expedition, but in confequence of his former attainder. The truth of the matter is, he was facrificed by the pufillanimous monarch to appeafe the Spaniards; who, whilt Raleigh lived, thought every pant of their dominions in danger. He was executed in Old Palace Yard, and bulied in St Margaret's adjoining, in the 66th year of his age.. His behaviour on the fcaffold was manly, unaffected, cheerful, and eafy. Being afked by the executioner which way he would lay his head, he anfivered, "So the heart
be right, it is no matter which way the head lies." He was a man of admirable parts, extenfive knowledge, undaunted refolution, and frict honour and honefly. He was the author of a great many works, fome of which bave not been printed.

RALLUS, the RAil, in ornithology; a genus belonging to the order of grallx. The beak is thickelt at the bafe, compreffed, equai, acute, and fomewhat fharp on the back near the point; the noltrils are oval; the feet have four toes, without any wcb; and the body is compreffed. Mr Latham, in his Index Orrithoiggicus, enumerates 24 fpecies, befides fome varieties. They are chiefly dittinguifhed by their colour. "Thefe birds (fays Buffon) conftitute a large family, and their habits are diffcrent \(f_{1}\) om thofe of the other fhore-birds, which refide on fands and gravel. The rails, on the contrary, inhabit only the flimy margins of pools and rivers, efpecially low grounds covered with flags and other large marfh plants. This mode of living is habitual and common to all the fpecies of water-rails. The land rail frequents meadows, and from the difagreeable cry, or rather ratulng in the throat of this bird, is derived the generic name. In all the rails, the body is flender, and thrunk at the fides; the tail extremely thort; the ticad mall; the bill pretty like that of the gallinaceous kitd, though much longer, and not io thick; a portion of the leg above the knee is bare; the three fore-toes without membranes, and very long : they do not, like other birds, draw their feet under their belly in flying, but allow them to hang down : their wings are imall and very concave, and their flight is fhort.They feem to be more diffuied than varied ; and nature has produced or tranfported them over the molt diftant lands. Captain Cook found them at the Straits of Magellan; in different iflands of the fouthern hemifphere, at Anamoka, at Tanna, and at the ifle of Norfolk. In the Society Iflands there are two feecies of rails; a little black footted one, (pooa-née), and a little red-eyed one (mai-ho). It appears that the two acolins of Fernandez, which he denominates zuater-quails, are of a fpecies of rails peculiar to the great lake of Mexico.The colins, which might be confounded with thefe, are a kind of partridges." 'The principal are,
1. The aquaticus, or water-rail, is a bird of a long flender body, with fhort concave wings. It delights lefs in fying than runuing: which it does very twifily along the edges of brooks covered with bulhcs: as it runs, it every now and then flirts up its tail, and in flying bangs down its legs; actions it has in common with the water-hen. Its weight is four ounccs and a half. The length to the end of the tail is 12 inches; the breadth 16. The bill is flender, flightly incurvated, one inch three quarters long: the upper mandible black, edged with red ; the lower, orange-culoured: the head, hind part of the neck, the back, and coverts of the wings and tail, are black, edged with an olive brown ; the throat, brealt, and upper part of the belly, are ath-coloured: the fides under the wirgs as far as the rump, finely varied with black and white bars. The tail is very fhort, confirts of 12 black feathers; the ends of the two middle tipt with rult colour ; the feathers imniediately beneath the tail white. Thic legs are placed far behind, and are of a dufky fefl. coluur. The toes very long, and divided to their very origin; though the feet are not webbed, it takes the waler; will fwim on it with much eafe, but is often obferved

\section*{R A L}

Rallus. to run along the furface. "Water rails (fiys luffon) are feen near the perennial fountains during the greatcit part of the winter, yet like the land rats they have their regular migrations. They pals Malta in the lpring and antumn. The Vifount de Quenhoent fin fome 50 leagues off the coafts of l'ustugat on the 17 th of A pril. They were fo fatigued, that they fuffered themfelves to be causht by the hand (a). Gmeita found thefe birds in the countries watered by the Don. Belon calls them bluk rails, and fays they are every where known, and that the fpecies is more numerous than the red ratl, or land rail. The flefh of the water rail is not to delicate as that of the hand rail, and has even a marfhy tafte, nearly like that of the gallinule. It continues the whole year in England."
2. The porzana, or gallinule, is not very frequent in Great Britain, and is haid to be migratory. Inhabits the fides of fmall itreams, concealing itielt among the buthes. Its length is niae incies; its breadth, 15 ; its weight, fur ources five drechms. The head is brown, fpotued with black; the neck a deep olive, fpotted with white: the feathers of the back are black next their fhafts, then oiive-coloured, and edged with white; the fcapulars are olive, finely marked with two fmall white fpots on each web: the legs of a yellowith green. "Its habits (fays Buffon) wild, its initinct Itupid, the porzana is untriceptible of education, nor is even capable of being tamed. We raifed one, however, which lived a whele tummer on crumbs of becad and hempfeed; when by iffelf, it kept conttanty in a large buwi of water; but if a perfon ensered the clolet where it was fhut, it ran to conceal itfelt in a fmalt ciark curner, with. out venting cries or mirmurs. In the tlate of liberty, however, it has a harp pielcing voice, much like the fcream of a young bird of prey; and though it has no propenfity to fociety, as toon as one crics, another repeats the found, which is thms conveyed throurh all the reft in the diltict. Lixe all the ralls, it is co obltinately averfe to rife, that the fporfman often feizes it with his hand, or fe!ls it with a ftick. If it finds a buth in its retreat, it climbs upon it, and from the top of its afylum beholds the dogs brufhing along in fault: this habit is common to it and to the water-rail. It dives, fwims, and even fivims under water, when hard pufhed.
"Thefe birds difappear in the deptio of winter, but return early in the fpring; and even in the month of February they are common in fome provinces of France and Italy. Their flefh is delicate, and much elteemed: thofe, in particular, which are caught in the rice-felds in Pledmont are very fat, and of an exquifite flavour."
3. The crex, crake, or corn-crek, has been fuppofed by fome to be the fame with the water-rail, and that it differs only by a change of colour at a certain featon of the year : this error is owing to inatention to their characters and nature, both which differ entirely. The bill of this fpecies is fhort, firong, and tlick; formed exactly like that of the water-hen, and makes a generical diftinction. It never frequents watery places; but is always found among corn, grafs, broom, or turze. It quits lritain before wmter; but the water-rail endures
their Oharpett feafons. They agree in their averfion to dight; and the legs, which: are remarkably long for the lize of the bitd, harg down whillt they are on the wing; they truf their lafety to their fritunefs on fout, and feldom are fiprung a fecond time but with great difliculty. The land raill lays from 12 to 20 eggs, of a dull white colcur, marked with a few yellow fonts; notwithfanding this, they are very mumerous in that kingdom. 'Their note is very fingular; and like the quail, it is decojed into a net by the imitation of its cry, orck creck crcck, by rubbing hard the blade of a I:nife on an indented bone. Molt of the names given in different languages to this bird are evidently formed to imitate this lingular ery. Hence Turner and fome other naturalitts have fuppofed it to be the crex of the ancients; but that term appears to have been applied by the ancients to other birds. Philus gives the crex the epithet of Badatrepos, or fauggijb-avinged, which would indeed futt the land-rail. Aritophancs reprefents it as migrating from Lybia: Aritotle fays that it is quarrelfome, which may have been attributed to it from the analogy to the quail ; but he adds, that the crex fecks to deltroy the nefts of the blackbird, which camot ap. ply to the rail, fince it never inhabits the woods. Still lefs is the crex of Herodotus a rail, for he comparcs its fize to that of the ibis, which is ten times larger. The avofet, too, and the teal, have fometines the cry crex, crex : and the bird which Belon heand repeating that cry on the banks of the Nile is, according to his arcount, a fpecies of godwit. Thus the found reinefented by the word crex, belonging to feveral fpecies, is not fufficiently prccile to ailtinguith the land-rail.

Thes are in greatelt plenty in Anglefea, where they appear about the zoth of A pril, fup;ofed in pals over from Ireland, where they abound: at their firft arrival it is common to thoot feven or eight in a morning. They are found in molt of the Hebride, and the Oikneys. On their arrival they are very lean, weighing only fix ounces; but before they leave that illand, grow to tat as to weigh above eight. The feathers on the crown of the head and hind-part of the neck are black, edged with bay colour: the coverts of the wings of the fame colour, but not fpotted; the tail is fhort, and of a deep bay: the belly white ; the legs ath-colonred.

RALPH (James), a late ingemious hitorical and political writer, was born, we know not when or where, being firt known as a fchoolmafter in Philadelphia in Nosth America. He went to Erghland about the beginning of the reign of George I. and wrote forse things in the dramatic way, which were not received with great applauic : but though he did not fucceed as a pree, he wis a very ingenious profe-writer. He wrote A Hinory of England, commoncing with the Stuarts, which is much eftcemed; as were his political effays and pamphlets, fome of which were looked upon as mafter-pieces. His laft publication, The Catc of Authors by Proleflion, is an excelient and catertaining performance. He died in 1762.

Rusis Honl, in a thip, is a great block belonging to the fore a:d main haulyuds. It has three fhives in \(i_{i}\), in which the haulyards are put; and in a hole at the cnd are resucd the tics.

RAMADAN, a folemn feafon of fafting among the Mohometans. Sue Maho:netanism.

KAMAH (anc. reogr.), a town of Benjamin, near Yibea, (Judges) ; called Rama of Sanl (1 S:am. xxii.), fix miles from Jerufalem to lae north ; memtrable for the fory ot the Levite and his concubine: Taken and hutified by loarfa king of Ifracl, in order to annoy the Linguom of Judals. This Rama is mentioned Ifi. x. I r . axai. and Math. ii. and is to be dittinguithed from Koma of Samuel, 1 Sam. six. called alfo Ramatha, 1 Sam. i. 19. and Ramathain Zop'bim, ibid. i. 1. which lay a freat way to the weft, towards Joppa, near Lydda, 1 Maccab. ii. the birth place of Samuel; adjnining to the monntains of Ephram, and the place of his relldence, 1 Sam. xv. Buc. (Jofephus). Called Ramala in the lower :ige, (Gul. Tyrius.) There is here a convent of the Fathers of the Holy Land, inhabited only by Portuguefe, Spaniards, and Italians.

RAMATH-mizpe, (Johua xiii.) ; Ramotl.Mafphe, (Septhagint, Vulgate) ; Ramoth in Giletd, or Remmath Gultad, (Scventy) ; a town in that tract of Gilead called Maspha, or Mispe, one of the cities of refuge.

RAMAZZINI (Bernardin), an Italian phyfician, born at Carpi near Modena in 1633 . He was profeffor of plyfic in the univerfity of Modena for 18 years; and in I 700 accepted an invitation from Padna, where he vas made rector of the college; and died in \(1714^{*}\). llis works were collefted and publifhed in London, 1716; of which, his treatife De Nlorbis Artificium, "Of the peculiar maladies of artificers," will always be efteemed ufeful and curious.

RAMEKINS, a fortrefs of the United Netherlands, on the foull coatt of the ifland of Walchevin, in the province of Zeland. One of the calltionary towns given to Queen Elizabeth for the repayment of the charges the had been at for the defence of this republic in iss infancy. Four miles eat of Flufhing ; in N. Lat. 51. 34. E. Long. 4. 24.

RAMESES, (anc. geog.) ; a town built by the Ifraelites during their bondage in Erypt, and from which the Exodus took place, and which mult have been towards and not far from the Arabian Gulph, feeing in the third fation the lfaclites arrived on its fhore.

KAMESES, king of the Lower Egypt when Jacol went thither with his family, in the 1706 th year belore the Chrifian era. Aiscient authors menton feveral other kings of Esypt of tha fame name; and it is thought that one of thole princes erected in the temple of the fun at Thebes, the magnificent obelifk which the emperor Comftantine caufed to be removed to Alexandria in the year 334 ; and that prince dying, his fon Conitantius had the obelifk tranfported from Alcxan. dria to Rome in 352 ; where it was erected in the rand Circus. Its height was 132 feet. When the Goths facked the city of Rome in 409, they overthrow this obelik, which continued buried in the fand till the time of Sixtus V . in 1587 , when it was found broken in thee picces; which being joined tongether, it was fet up in the fquare of St John de Lateran. On the four fides of
roglyphical characters, which, according to the explication of Amnianus Marcellinus, contain the praifes of Ramilies. pameres.

RAMIFICATION, the production of boughs or branches, or of figures refembling branches.

RAMLLLIEe, a fmall village of Brabant, in the A uilrian Low Countries, 12 miles north of Namur, and 22 fouth-eaft of Bruffels. Lat. 50. 5 1. Long. 4 . 48. Famous for the battle fought by the allies commanded by the duke of Marlborough and M. D'Auverquirque, againft that of the two crowns, commanded by the Duke of Bavaria and Marfhal Villeroy, the 22d of May r7o6. See Britaln, n 357.

The troops deflined to compofe the army of the allies being jcined at the camp of Borchloon the 20 th of May, halted the 2 It . On the 22 d the army marched from Borchloon in four columns, and potted itfelf the fame day, with the right towards the Mill of Quorem, extending with the left towards Blehen: from this camp was difcovered the army of the two clowns, which was encamped with the left at Over-Efpen, and the right towards the wood of Chapiaraux, Heyliffem in their front, and Tirlemont in their rear. It was refolved the fame day to march the next morning towards the plain of Meerdorp or Mierdan, to view the pofture of the enemies, and determine what would be the molt proper mcans of attacking them according to the movement they fhould make. To this end, an advanced guard of Sco horfe and all the quarter-maters of the army were fent forward on the 23 d at break of day.

The fame morning about four, the army marched in eight columns towards the aforefaid plain. The advanced guard and the quatter-mafters arrived about eight at the height of Meerdorp or Mierdau; from whence the army of the enemy was feen in motion : a little after it was perceived that the enemy was marching through the plain of Mount St Andrew in four columns, of which information was given to the duke of Marlborough and M . D'Auverquirque, who immediately repaired to the faid height; and by the time thefe generals were arrived there, the head of the enemy's army already appeared at the tomb of Ottomont upon the caufeway, near the Mehaigne: whereupon the Duke of Marlborough and M. D'Auverquirque made the army advance with all expedition.

The enemy, as faft as they advanced, ranged in order of battle, with their right tonards the tomb of Ottomont upon the Mehaigne, extending with their left to Autr' Eglife; having Tranquers in front of their right, into which they had thrown feveral battalions of inlantry and it fquadrons of dragoons, who had difmounted their horfes to fupport them. They had placed many of their infantry and a coufiderable part of their artille\(1 y\) in the villaye of Ramillies, which fronted the right of their main body, as well as into the village of Offuz, which fron:ed the left of their infantry, and into the village of Autr' Eglife, quite on their left. The front between the villarge of Ramillies and Autr'Eglife was covered by a fmall ftream of water, which rendered the meatows in fome places mardhes, and alfo by feveral roads covered with hedges; which difficulties prevented the allied cavalry of the right wing from coming to action. As fatt as the army of the allies arrived it was ranged in order of battle; with the left towards

Bonnef,

Ramillics Bonnef, and the right towards Foitz, and every thing
\|l was difpofed in order to attack. 'l'o this end, four Rampart, battalions were detached to attick the village of Franquenies, and twelve battalions to attack the village of Kamillies, which were to be fupported by the whole infantry.
'fhe artillery began to cannonade the enemy at one; at about two, the attack began with the poft of Franquenies, where the infuntry had the good fortune to dive the encmy from the hedges, where they were advantageoufly pofled, and at the tame time all the cavalry of the left wing advanced to attack that of the enemy's right; foon ather all was in action. Whilft the cavalry were engaged, the village of Ramillies was like. wife atacked, and forced aftel a vigorous refiftance.

The battle lafted :bout two hours, and was pretty obflinate ; but fo foon as the allied cavalry hid grined ground enough to attack the enemy in flark, they began to give way; at the fanse time all their inf.mery were put in diforder, fo that the whole retrented in great contufion. The cavalry of their lett wing formed a little upon the high ground, between Offuz and Mount St Andrew, to favour their retreat: but after the infantey and cavalry of the right wing of the allies had filed off bet ween the bottom of the vilhage of Ramillies and Ofuz, the whole army marched in ieveral columns to attack the enemy anew; but they gave way before the allies could come up with them, and retired in great confufion, fome towards the defi'e of the Abbey De La Ran:će and towards Dongelberge, others towards Judogne, and others again towards Hougarde. They were purfued all night fo clofely that they were obliged to abandon all their artillery and baggage, part of which was found at Judogne and at Hougarde, with their cheits of ammunition.

The cnemy loit above 30,000 men, 60 cannon, 8 mortars, Randards, colours, baggage, \&c. the allies about 3000. The reft of the campdign was fpent in the fieges of Oftend, Menin, and Aeth. In fourteen days the Duke defeated and difperfed the beft appointed army the French ever had, and recovered all Spanilh Brabant, the marquifate of the holy Roman empire. The army of the enemy confifted of 76 battalions and 1,42 fquadrons, including the king's houfehold troops (La Maijon \(d u\) Roi); and the army of the allies was \(7+\) battalions and 123 fquadrons. Confidering the importance of the viftory, the lols of the allies was very fimall, not above 1100 being killed, and 2600 wounded.

RAMLA, the modern name of Arimathea. See Arimathea.

RAMMER, an infirument ufed for driving down fones or piles into the gromen; or for beating the earth, in order to render it mole folld for a foundation.

Ramarfr of a Gun, the Gun-flick; a rod uied in charging of a gun, to drive horae the powder, as alfo the fhot, and the wad which keeps the fhot from rolling out.

RAMPANT, in heraldry, a term applicd to a lion, leopard, or other bealt that flands on its hind legs, and rears up his fore-feet in the pofture of climbing, Howing only half his facc, as one eve, \&c. It is different from faliant, in which the beaf feems fpringing forward as if making a fally.

RAMPART, in fortification, is an elevation of earth round a place capable of relifting the camnon of an cnemy; and formed into battions, curtains, \&c.

RAMPHASTOS, the 'TOUCAN, in umichulteg'. Rany, forSee Rhamphastos.

RAMSAY (Allan), the Sents panoral pnet, was a Penni.y. barber in Edinburgh in the early part of the pretent century. His tatle in poctry, however, has juttly raifed him to a degree of fame that may in fonic meatiare he contidered as a recompente for the fromus of fortunc. His fongs are in univerfal eneem; as is alfo the only dramatic performance ateributed to hin, viz. Palie and Roocr, or The Gentle Shepherd, a Scots paItoral. He died in \(17+3\); and was father to the inge. mous Mr Ramfay, a cclebrated paintcr of the prefent age, and who has likewife diftinguithed himfolf by fome well-written trats on various branches of polite literature, particularly the Invefigator.

Ramsay (Andrew Mlichatel), generally known hy the name of the Chevalier Rampa), was a pelite Scots writer, born of a good family at Ayr in 1686. His good parts and learning recommended him to be tutor to the fon of the earl of Wemy fs ; after which, conceiving a difguft at the religion in whicl: he had been educated, he in the fame ill humour reviewed other Chritlian churchas; and, finding none to his liking, refted for a while in Deifm. While he was in this uncertan flate of mind, he went to Leyden; whe:e, falling intn the company of one Poiret a myltic divine, he received the infection of myfticifm : which prompted him to confult M. Fenelon, the celebrated archbifhop of Cambray, who had imbibed principles of the fame nature; and who gained him over to the Catholic religion in \(1,09\). Tre ubbequent courte of his life received its direction from his frendllip and connctions with this prelate; and being appointed governor to the duke de Chateau Thierry, and the prince de Turenne, he was made a knight of the urder of St Lazarus. He was fent for to Rome by the chevalier de St George, to undeitake the education of his children; but he found fo many intrigues and diffenfions on his arrival there in 1724 , that he obtained the Chevalier's leave to return to Paris. He died in \(17+3\), in the office of intendant to the duke of Bouillon, prince de Turenne. The moft capital work of his writing is the Travels of Cyrus, which has been feveral times printed in Englifh.

Ramay (the Reverend James), fo juftly celebrated for his philanthropy, was, on the 25 th of July 1733, born at Frafertburgh, a fmall town in the county of Aberdeen, Norila Britain. His defcent was honourable, being, through his father, fiom the Ramiays of Melrofe in Banfishire, and through his, mother, from the Ogilvies of Purie in Angus. His parents were of chatacters the moft refpectable, but in circumftances by no means affuent. From his carlieft ycars he difcovercd a ferions difpotition, and a ftrong thirft \(f x\) knowledge; and after pafing through the courfe of a Scotch grammar fchool edication, he was inclined to purfue the fludies requifite to fit him for the protefion of a clergyman; an inclination with which the wifles of his m ther, a womm of eminent piety, powerfully concurred. Several circum tances, however, confired to divert hinl for a time from his favourite purtuit.

He was educated in the erifonpal perfuarion ; and having been unhappy enough to lofe his father while yet very young, be found, upon his advancing towards the fate of maribood, that the joint fortunes of himfill and
his moilher couid not bear the expence of a regular education in either of the mivertitits of Oxford or Cambridge, which te doubtlels thought abfolutely neceffary to one who affired to refpectability in the church of Fingland. Yielding therefore to neceflity, he refolved to ltudy furgery and pharmacy; and was with this view bound apprentice to Dr Findlay, a plyffician (A) in Frafetburgh. But though obliged to reliquifh for a time his favourite Audies, he did not think ignorance excuTab'e in a furgeon more than in a clergy man, or conceive that lie could ever bcome eminent in the profeffion in which circunftances had placed him, merely by fkill in fetting a bone or compounding a medicine. He determined therefore, with the full approbation of his mafter, who very foon difcovered his taler.ts for literature, to make himfelf acquainted with at leaf the outlines of the liberal arts and fiences; and with this view he repaired in 1750 to the King's College and univerfity of Aberdeen, where he obtained one of the burfaries or exbilifions which are there annually beftowed upon fuch candidates for them as difplay the moft accurate knowledge of the Latin language. The fmall fum of five pounds, however (which none of thefe burfaries exceed), was ftill inadequate to the expence of refidence in college ; but our young fludent was foon to obtain a mere valuable exhibition, and to obtain it likewile by his own merit.

During the long vacation he returned to his mafter Dr Findlay, and was by him intrufted with a very defperate cafe in furgery, of which his management may be laid to have luid the foundation of his future fortunes. A female fervant of one of the judges of the Court of Sefion, who, when the court was not fitting, refided in the neighbourhood of Fraferflourgh, had been fo dreadtully gored by a bull, that hardly any hopes were entertained of her recovery ; but Mr Ramfay, to whofe care the was entirely left, treated the wound wich fuch filiful attention, that, contrary to general expectation, his patient recovered. This attracted the judge's notice, who having informed himfelf of the young man's circumftances and character, recommended him fo effectually to Sir Alexander Ramfay of Balmain, that he prefented him with a burfary of 15 pounds a-year, which commenced at the next feffion or term, in the fame college.

He now profecuted his Rudies with comfort; and though he was detained in college al year longer than is ufual, being obliged, upon his acceptance ot a fecond burfary, to begin his courfe anew, he always confidered this as a fortunate circumftance, becaufe it gave him the celebrated Dr Reid three years for his preceptor. To that great and amiable philofopher he fo recommended himfelf by his talents, his induftry, and his virtues, that he was honoured with his friendhip to the day of his death. Nor was it only to his mafters that his conduet recommended him ; Sir Alexander Ramfay, whom he vifited during lome of the vacations, was fo well pleafed with his converfation, that he promifed him
another burfary, in his gift, of 25 1. a-year, to commence immediately on the expiration of that which he enjoyed. This promife he performed in the beginning of the year 1755 ; and at the folicitation of Dr Findlay even paid the money per advance to enable the exhibio tioner to travel for the purpofe of improving himfelf in his profeffion.

Thus provided, Mr Ramfay went to London, and ftudied furgery and pharmacy under the aufpices of Dr Macanly; in whofe family he lived for two years, careffed and efteemed both by him and by his lady. Afterwards. having paffed the ufual examination at Surgeon's-hall, he ferved in his medical capacity for feveral years in the royal navy; but how long he was continued in the fation of a mate, or when and by whom he was firft appointed furgeon, we have not been able to learn. We can fay, however, upon the beft authority, that by his humane and diligent difcharge of his duty in either ftation. he endeared himelf to the feamen, and acquired the efteem of his officers.

Of his humanity there is indeed one memorable infance, which mutt not be omitted. Whillt he acted as furgeon of the Arundel, then commanded by Captain (now Vice-admiral Sir Charles) Middleton, a flave-fhip on her paffige from Africa to the Weft Indies fell in with the fleet to which the Arundel belonged. An epidemical difemper, too common in fuch veffels, had fiwept away not only a great number of the unfortunate negroes, but alfo many of the hip's crew, and among others the furgeon. In this diftreffed fituation the commander of the Guinea fhip applied to the Englift Commodore for medical affiltance; but not a furgeon or furgeon's mate in the whole fleet, except Mr Ramfay, would expole himfelf to the contagion of fo dangerous a diltemper. Prompted, however, by his own innate benevolence, and fully authorized by his no lefs benevolent commander, the furgeon of Arundel, regardlefs of perfonal danger, and trufting in that God to whom mercy is more acceptable than facrifice, went on board the infected fhip, vifited all the patients, and remained long enough to leave behind him written directions for their future treatment. If a cup of cold water given in charity be entitled to a reward, how much more fuch an action as this? But the rewards of Chriftianity are not immediate. Mr Ramfay indeed efcaped the contagion; but on his return to his own hhip, juft as he had got on the deck, he fell and broke his thighbone; by which he was confined to his apartment for ten months, and rendered in a fmall degree lame through the remainder of his life.

The fearlefs humanity which he difplayed on this occafion gained him the friendthip and efteem of Sir Charles Middleton, which no future action of his life had the fmalleft tendency to impair; but the fracture of his thigh-bone and his fubfequent lamenefs determined him to quit the navy, and once more turn his thoughts towards the church. Accordingly, while the Arundel lay at St Chritopher's, he opened his views to
fome
(A) In the remote towns of Scolland the fame man generally acts in the triple capacity of phyfician, furgeon, and apothecary; and we could mention doctors of phyfic of the firl eminence, who practife thus within forty miles of Edinburgh.

\section*{R A M}
\(\underbrace{\text { Rampay: }}\) fome of the principal inhabitants of that ifland, by whom he was to ftrongly recommended to the bithep of I.nndon, that on his coming home with Sir Charles Middleton, who warmly joined in the reenmmendation, he was admitted into orders; after which he immediately returned to St Cluiltopher's, where he was pretented by the guvernor to two retcrica, valued it 700 1. at year.

As foon as he took poflellion of his livings, in 17632 he married Mufs Rebecea Akers; the danghter of : planter of the beff family-conncitions in the ifland, atd began to regulate his houfehold on the pious plan inculeated in his Efay on the Treatment and Converfion of the -1frican Slaves in the britilb Sugar Colonies. He fummoned all his own thaves daily to the prayers of the family, when he took an opportunity of pointing ont to them their duty in the planeft terme, reproving thofe that had done amifs, and commending fuch as had thown any thing like virtue; but he confeffed that his necafions for reproof were more frequent than for commendation. As became his oflice and character, he ineulcated upon othars what he practifed himfelf, and knew to be equally the duty of all. "On his firlt fettlement as a minitter in the Weft Indies, he made fonse piblic attempts to inflruct flaves. He began to draw up fome eafy, plain difcourfes lor their inferuction. He invited them to attend on Sundays, at particular hotiss. He appointed hours at home to inftruct fuch fenfible flaves as would of themfelves attend. He repeatedly exhorted their maters to encourage fuch in their attendance. He recommended the French cutrom, of heginning and ending work by prayer. But inconceivable is the lifteff. neis with rhich he was beard, and bitter was the eenfure heaped on him in return. It was quickly fuggeft ed, and generally believed that he wanted to intenupt the work of flaves, to give them time, forfooth, to fiy their prayers; that he aimed at the making of then Cloriftians, to render them ircapable of being good flaves. In one word, he ftood, in opinion, a rebel conrift againit the intereft and majefty of planterfhip. And as the Jews fay, that in every punifhment, with which they have been proved, fince the bondage of Egypt, there has been an ounce of the golden ealf of Horeb; fo might he fay, that in every inftance of prejudice (and they were not a lew) with which, till within a year or two of his departure from the country, he was exercifed, there was an ounce of his fruitlels attempts to impove the minds of flaves. In the bidding prayer, lie lad inferted a petition for the converfion of thofe perfons. But it was deemed fo diligreeable a memento, that feveral white people, on account of it, left off attending divine fervice. He was obliged to omit the prayer inliteir, to try and bring them bark. In lhort, neither were the haves, at that time, defirous of being tanght, ner were their matters inclined to encourage them."

That lie was hurt by this negleet cannct be queftioncd, for he had an mind benevolent, warm, and imitable; tut he fill retained many friends arnongtl the men worthy members of the communitr: and as he was conficus of having done nothing more than his duty, he confoled hindeif with reflecting, that thofe are "blefled whimmen revile, and perfecute, and fpeak all mannar cf willacaint fallely, for the fake of the goipel."
Althwugh his ferious ftudies were now theological, l.c confidered himfelf as anfwerable to Ged, !is country, Vol. XV'.

\section*{793 ] \(R \wedge M\)}
and his own family, for a proper ufe of every braucho of kanfus. knowledge which he polletied. I Ie therefure took the charge of fever al pantations around him in the capacity of a medieal prattitioner; and attended therm winh unremitting dilgence, and with yreat fuccels. Thus l. lived till the year 177ラ, when relinquithing the 1 ratitice of phylic entircly, lic paid as vilt to the place of his mativis, which he had not feen fince \(1755^{\circ}\). His mother, whofe later days he had made ecomfortal! \(\mathrm{b}_{\mathrm{j}}\) a hand. fome annuity, load been dead for fome years ; but he rewarded all who had heen attentive to her, or in ear'y lite ferviceable to limefelf; and lie continued the pention to a lifter who had a numerous family, for which her hufband was unable to provide.

After remaining three weeks in Scotland, and near a year in England, during which time he was admited into the contidence of Lord George Germaine, fecretary of fate for the American depariment, Nr lianfay rias appointed chaplain to Adminal Barrington, then going ont to take a command in the Weit Inclies. - Under this gallant officer, and afterwards unt der Lord Rodney, he was prefent at feveral engagements, where difplayed a fortitude and zeal for the honour of his country which would not have difgraced the cldeft admiral. To the navy, indeed, he feems to have been ftrongly attached; and he wrote, at an early period of his life, an Ellay c:n the Dr!! and Qualifatigns of a Sed-officer, with tuch a knowledge of the fervice as rould have done honour to the pen of the moft experienced commander. Of the firlt edition of this effay the profits were by its benevolent author appropriated to the Magdalen and Britilh lying-in hofpitals, as thofe of the fecond and third (which laft was publifned about the period of which we now write) were to the maritime fehool, or, in the event of iss failure, to the marine fociety.

Although carefied by both the admirals under whom he ferved, and having focle influence with the latrer as to be able to render effential fervices to the Jews arml other perfons whom he thought harkiy treated at the cap:ure of St Euftatius, Mr Ramfay once more quitted the fea-ferviee, and retired to his paftoral charge in the Itland of St Chrifopher's, There, however, though the former animofties a gain't him had cntirely fablided, and though his iriendhip was now fulicited by every pation of confequence in the illand, he remained but a little while. Siel- of the life of a planter and of the profpect of flavery around him, he refigned his livinvs, bade adieu to the inhand, and returned to Eneland with his wile and family in the end of the year i-si. lmmediately on his arrival, te was, throngh the interdt of his fteajy friend Sir Charles Middleton, preconted to the livings of Telton and Nettleftead in the county of Keat.

Here he was foon determined, by the adrice of thofe whom he moft refpeted, to publith an \(E\) Joy, which ha! been written many years before, on the Fricatmont and Coneverion of Alrican Slazes in the Tivi:ith Surtion Cebla. nies. 'The controvery in which this publication involved him, and the acrimony with which it was carried on, are fo frefl in the memory of all our readers, that no man who thinks of the narrow limits within whach our biographical atieles mutt be eonnined, will blame us for not entering into a detail of the part culars.'Torrents of obloytuy were poured upon the benerwient anthor by writer, who wer: natine mough to comeal \({ }_{5} \mathrm{H}\)

Ramfay, Ran:[den's जacline.
their names; and it mun be confoffed, that his replies abounded with farcafms, which the moit rational friends to the caufe which he fupported would not have been forry to fee blotted from his pages. The provocation, huwever, which he received was great ; and Mr Ramfaly, thoughi an aminble, virtuons, and pious man, had a warmith of temper, which, though not deferving of praife, will be centured by none wlao refleft on the frailties of cur common nature. That the particular calumnies propagatcd againt him on this occation were wholly gronnilefs, it is impoffible to doubt, if we admit him to have been poffefed of common underftanding. When fome years ago a fory was circulated, of Swift's having, when prebendary of Kilroot, been convicted before a magiftrate of an attempt to commit a rape on the body of one of liis parifhioners, it was thought a fulficieni confutation of the calumny to put the retailer of it in mind, that the dean of St Patrick's, though detefed by the molt powerful faction in the king dom, lampooned without dread, and with great feverity, the dean of Ferns for the very crime of which, had this anecllote been true, he mult have been confious that all Ireland knew himfelf to be guilty? Such conduat cannot be reconciled to common fenfe. Had Swift been a ravifher, though he might have been penitent, and reafoned in general terms againt giving way to fuch licentious paffions, he would never have fatyrifed a farticular perifon for the crime of which he himfelf flood conviad. In like manner, had Mr Ramfay been a tyrant to his own flaves, though he might have argued againt flavery in the abtract, on the broad bafis if virtue and religion, he never could have arraigned for fimilar cruelty a number of individuals in the very iflud which witneffed his own enormities.

But the melancholy part of the narrative is behind. Thie agitation given to his mind by thefe calumnies, and the fatigues he underwent in his endeavours to reicue from mifery the moft helplefs portion of the human tace, contributed to fhorten a life in no common degree uicful. He had been for fome time aflifted with a pain in his fomach, for which he was prevailed upon, tho' with great reluctance, to try the effects of air and excrcife, by attempting a journey of 100 miles. But in London, being feized with a riolent vomiting of blood, he was unable either to proceed or to be removed home; and in the houfe of Sir Charles Middleton he enced his days, on the 20th of July 1789 , amidtt the groans of bis family, and the tears of many friends.Thus died a man, of whom it is not too much to fay, that "the bleffing of many that were ready to perifh came upon him;" for whatever be the fate of the flavetrade (iee Slafery), it is certain that his writings have contributed much to meliorate the treatment of flawes. He left behind him a widow and three daughters: and his works, befides thofe to which we have alluded, conifit of a volume of Sea-formons, preached on hoard his majefty's fhip the Prince of Wales, which thow him to have been a matter of true -pulpit-eloquence; and a Treatife on Signals, trhicis was certainly written, and we think printed, though we how net whether it was ever publifhed.

RAMSDEN's Machine for Dividizg Mathema. tical Instrumbnts, is a late invention, by which thefe divifions cas be performed with exceeding great accuracy, fuch as would formorly have been deemed in-
credible. On difcovering the method of confiracting Ramden's this nachine, its inventor, Mr Ramfden of Piccadilly, Machine. rcceived 615 l. from the conmifioners of longitude; engaging himfelf to inftruct a certain number of perfons, not exceeding ten, in the method of making and uling this machine from the \(28: h\) Oftober 1775 to 28th October \({ }^{17777}\) : alfo binding himfelf to divide all octants and fextants by the fape engine, at the rate of three Chillings for eacl: cotant, and fix fhillings for each brals fextant, with Nonius's divifions to balf minutes, for as long lime as the commifioners fhould think proper to let the engine remain in his poffeffon. Of this fum of 615 1. paid to Mr Ramiden, 3001 . was given him as a reward for the improvement made by him ia difovering the engine, and the remaining 3151. for his giving up the properiy of it to the commiffoners. The following detcription of the engine, is that given upon oath by Mr Ramflen himfelf.
"This engine confilts of a large wheel of bell-metal, fupported on a mahogany ftand, having three legs, which are ftrongly connected together by braces, fo as to make it perfectly feady. On each leg of the ftaud is placed a conical friction-pulley, whereon the dividing-wheel relts: to prevent the wheel from fliding off the friction-pulleys, the bell-metal centre under it turns in a focket on the top of the ltand.
"'The circumference of the wheel is ratched or cut (by a method which will be defcribed hereafter) into 2160 teeth, in which an endlefs fcrew acts. Six revolutions of the fcrew will move the wheel a fpace equal to one degree.
"Now a circle of brafs being fixed on the fcrew arbor, having its circumference divided into 60 parts, each divifion will confequently anfwer to a motion of the wheel of 10 feconds, fix of them will be equal to a minute, scc.
-S Several different arbors of tempered fteel are truly grourd into the fecket in the centre of the wheel. The upper parts of the abors that fand above the plane are turned of various fizes, to fuit the centres of different pieces of work to be divided.
"When any intrument is to be divided, the centre of it is very exatly fitted on one of thede arbors; and the inftrument is fixed down to the plane of the dividing wheel, by means of fcrews, which fit into holes made in the radii of the wheelfor that purpofe.
"The inftrument being thus fitted on the plane of the wheel, the frame which carries the dividing-point is conneted at one end by finger-fcrews with the frame which carnies the endlefs fcrew; while the other end embraces that part of the fteel arbor, which ftands above the inffrument to be divided, by an angular notch in a piece of hardened Ateel; by this means b th ends of the frame are kept perfecily feady and free from any flake.
"The frame carrying the dividing-point, or tracer, is made to flide on the frame which carries the endlefs fcrew to any diftance from the centre of the whel as the radius of the inftrument to be divided may require, and may be there faflened by tightening two clamps; and the dividing-point or tracer being connected with the clamps by the double-jointcd frame, admits a free and cafy motion towards or from the centre for cutting the divifions, without any lateral fhaks.
"From what has been faid, it appears, that an intrument

\section*{R A M}

Ramfon's frument thus fitted on the dividing-wheel maty be Machine, moved to any angle by the ferew and diviticd circle on its atbor, and that this angle may be marked on the limb of the infrument with the greate? exactnefs by the dividing-point or taacer, which can only move in a direat line tending to the centre, and is alogether frechliom thofe inconveniences that attend entting by means of a ftraight edge. This method of drawing lines will allo pferent any error that might arife from an expmation or contraction of the motal during the time nf dividing.
"The ferere-frame is fixed on the top of a conical jillar, which turns fiecly round its axis, and alio moves frecly cowards or from the centre of the wheel, fo that the ferew-frame may be entirely gnided by the fiame which comects it with the centre: by this means any excentricity of the wheel and the arbor would not produce any enor in the dividing ; and, by a particular contrivance (which will be defcribed hereafter), the forew when prefled argainf the teeth of the wheel always moves parallel to itfelf; fo that a line joining the centre of the arbor and the tracer continued, will diways make equal angles with the fercir.
Hate " ligure I . repreients a perfpeaive view of the eneccoxxxil, gine.
Plate "Fig. 2, is a plan, of which fig. 3. reprefents a feccocceserv, tion on the line 13.A.
"The harge whecl \(A\) is 4.5 inches in diameter, and has ten radii, each baing fupported by edge-bars, as reprefented in fig. 3. Theee bars and radii are connedted by the circular ring \(B, 2+\) inches in diameter and 3 deep ; and, for greater frength, the whole is caft in one piece in bell-metal.
" As the whole weigite of the wheel A refts on its ring \(B\), the edge.tars are deepeft where they join it; and from thence their depth diminihes, both towards the centre and the circumference, as reprefented in flg. 3.
"The furface of the wheel A was worked very even and fat, and its circumference turned true. The ring C, of fine brais, was fitted very exacily on the circumference of the wheel; and was fattened thereon with fcrews, which, after being ferewed as tight as poffible, were well rivetted. The face of a large chuck being tarned very true and fat in the lath, the flattened fur-
Eig. 3. face \(A\) of the treel was faftencl againt it with huldfalts; and the two furfaces and circumference of the sing \(C\), a hole through the centre and the plane part round (b) it, and the lower etge of the ting \(B\), were turned at the fame time.
- \(D\) is a picec of hard bell-netal, having the hoie, which receives the ficel-abor (d), made very thraight and true. This bell-metal was turned very true on an arbor; and the face, which relts on the wheel at (b), was turned very fat, fo that the feel arbor (d) might liand perpendicular to the pane of the wheel: this leell-meral was faftened to the wheel by fix necl firews (1).
"A Arafs focket \(\approx\) is fafened on the centre of the mahogany tand, and receives the lower pare of the i,ell-metai piece \(D\), being made to couch the bellme:al in a narrower part near the mouth, to preventany obliquity of the whect-from bending the atbor: good i.taing is by no means noceffary lere ; fince any leake
in this focket will produce no bad cflect, as wilh appcar an ab ben" hereafter when we defcribe the cutting frame.
"The wheel was then put on its ftand, the lower i, \%. \% edge of the ring \(B\) relting an the circunalerenc: ofarit threc conical frictinn-pulleys \(W\), to facilitate jts liantion round its centre. The axis of one of thele pulley; is in a line j ining the centre of the whel :and th: middle of the endlefs frew, and the other two placed fo as to be at equal ditances from each cther.
" F is a block of wood frongly fatened to whe of the Fig. 1. legs of the thand ; the piece \((\xi)\) is feretred to the upper licle of the block, and has half holes, in which the tranferfe :axis (h) turns: the half hules are bett toge Fig. a. ther by the ferews (i).
"The lower extremity of the conical pillar Picrnis- Tig. I. \& a nates in a cylindrical fteli-pin (k), which paties hlerough :is. q. and tarns in the tranferf: axis ( L ), and is confined by a check and fcresp.
"To the upper cnd of the conical pillar is faftencal the frame G, in which the endiefs forew tams: the Fio. 4. pivots of the ferew are formed in the manncr of two iruatums of cones joined by a cylinder, :ls repreenied at K . There pirots are comfined betreen i:alf poles, which prefs only on the conical pants, and co Fig. \(\overline{5}\). not touch the cylindicic parts: the half Loles anc kept together by ficews (a), which may be tightencd at atay time, to prevent the licew from thaking in the frame.
"On the ferewarbor is a fmall wheel of brafs h, lig. r, z. having its outlide edge divided into 60 pats, and num- 4,5 . bered at every 6 th divifion with 1, 2, \&c. to 10. The motion of this wheel is fhown by the index (y) on the Fig. 4. \& 5. frrew-frame \(G\).
" It reprefenis a part of the Atand, having a parallel Fig i. flit in the direstion towards the centre of the wizel, large enough to reccive the upfer part of the conical brafs pillar \(P\), which carries the forew and its thame: and as the refifance, when the wheel is moved by the endlefs fercw, is againt that fide of the flit H which is towards the left hand, that fide of the fiet is faced with brafs, and the pillar is prelled againft it by a fteel fpring on the oppofite fide: by this means the pillar is frongly lupported laterally, and yat the ferew inay be catily prefled from or againf the circumiference of the wheel, and the pillar will tura frecly on its axis to take any direction given it by the frame 1. .
"At each corner of the pisce I aie fcrews ( \(n\) ) of \(\Gamma\) fig. A. tempered fteel, having polifhed conical poinss : two of them turn in conical holes in the ferew-frame near ( 0 ), and the points of the otiner two firews turn in hoics in the piece \(Q\); the ferews \((P)\) are of frecl, which being tightened, pievent the conical pointed fieews from mo turning when the frame is moved.
"L is at braff frame, which ferves to conneer the enci- Fig. \(1,-2 \sqrt{2}\) lefs fcrew, its frame, Sec. with the centie of th: wheel: each arm of this frame is terminated by a feel ficrew, that may be palfed through any of the holes (q) in the Fiz. A. fisce \(Q\), as the thicknefs of work to be divided on the whe il may require, and are taftened by the finger- Fig. I. © zo. nuts ( r ).
"At the other end of this frame is a fat pisce of tempered fleel (b), wherein is an angulat moth: when lis. C. the endlefs ferew is preffed agsinint the teath on the ci:cunference of the whel, which may be cone by turn- ries. \& in ing the finge: frew si, to preis agunt ine pring (i),
\(5 \mathrm{H}=\)

\section*{R A M}

Ranfden's this notch embraces and preffes againft the fteel arbor Machive. fig. 2 . (d). This ent of the frame may be raifed or depreffied by moving the primatic flide (u), which may be fixed IIG. \(1,2,6\) at any height by the four ftel-fcrews ( v ).
Fig. \(1 \& 6\). "The bottom of this nide has a noteh ( \(k\) ), whofe plane is paraltel to the endlefs-frew ; and by the point of the albor (d) refting in this nutch, this end of the frame is prevented from tilting. The ferew \(S\) is preyented from unturning, by tightening the fingermut (w).
" The teeth on the circumference of the wheel were cut by the following method:
"Having confidered what number of teeth on the circumference would be mof ecnvenient, which in this engine is 2160 , or 360 muliplied by 6 , I made two forews of the fame dimenfions, of tempered thed, in the manner hereafter defribed, the imerval between the threads being fuch as I knew by calculation would come within the limits of what might be turned off the circumference of the whel : one of thefe ferews, which was intended for ratching or curting the teeth, was notehed acrofs the threads, fo that the forew, when preffed againtt the edge of the whecl and turned round, cut in the manner of a faw. Then having a fegment of a circle a little greater than 60 degrees, of about the fame radius with the wheel, and the circumference whade true, from a very fine centre, I defribed an arch near the edge, and let off the chord of 60 degrees on this arch. This fegment was put in the place of the wheel, the edge of it was ratched, and the number of revclutions and parts of the fcrew contained between the interval of the 60 degrees were counted. The 1 1adius was corrected in the proportion of 360 revolutions, which ought to have been in 6 degrees, to the number astually found: and the radise, fo correfed, w.1s tuken in at pair of beam-compaffes: while the Wheel was on the lath, one foot of the compaffes was put in the centre, and with the other a circle was deforibed on the ring; then half the depth of the threads of the ferew being taken in dividers, was fet from this circle outwards, and another circle was deferibed cutring this point; a hollow was then turned on the clage of the wheel of the fame curvature as that of the ferew at the botom of the threads : the bottom of this horllow was turned to the fame radius or diftance from the centre of the wheel, as the outward of the two circles beforementioned.
"The wheel was now taken of the lath; and the bell-metal piece 1 ) was ferewed on as before direfed, which after this ought not to be removed.
"From a very exact eentre a circle was doftibed Th. \(3.2,3\). On the ring \(C\), about \(\frac{4}{10}\) of an inch within where the bottom of the teeth would come. This circle was divided with the greater exacnefs I was capable of, firle into dive parts, and each of thele into thrce. There parts were then b fected four times: (that is to fay.) fuppoling the whole circumerence of the whet to con. tain 2160 teeth, this being divided into five parts, e:th would contain 4.32 teeth : which being divided into three farts, each of them would contain \(1+4\); and this face
bifected four times would give \(72,36,18\), and 9 : there. Ranafden's fore each of the laft divilions wrould contain nine tcetl. Nachine. But, as I was aprrehenfive fome error might ariie from qu'nquefeation and trifection, in order to examine the accuracy of the divifions, I defribed another circle on the ring C , \(\frac{r^{\frac{3}{0}}}{}\) inch within the former, and divided it Fig. \% by contmull hilections, as 2160 , 10 So, \(540,=70,135\), \(67^{\prime}\), and \(33^{\frac{3}{7}}\); and as the fixed wire (to be defcribed prefently) crolfed both the circles, f could examine their agreement at every 135 revolutions; (after ratching, could examine it at every \(33 \frac{3}{4}\) ) : but, not finding any fenlible difference between the two fets of divifions, I, for ratching, made choice of the former; and, as the coincidence of the fised wire with an interfection could be more exactly determined than with a dot or divifion, I therefore made ufe of interfeations in both circles before defrribed.
"The ams of the frame L were connested by a thin Fig. \%. picee of brafs of \(\frac{3}{7}\) of an inch broad, having a hole in the middle of \(\frac{4}{50}\) of an inch in diameter; acrofs this hole a filver wire was fixed exaatly in a line to the centre of the wheel; the coincidence of this wire with the interfections was examined by a lens \(\frac{7}{3}\) o inch focus, fixed in a tube which was attached to onc of the arms L (A). Now a handle or winch beng fixed on the end is the frrew, the divition marked ic on the cirele K was fot to its index, and, by means of a clamp and adjulting forew for that purpofe, the interfection marked 1 on the circle \(C\) was ict exaally to coincide with the fixed wirc ; the forew was then carefully preffed againt the circumference of the wheel, by turning the finger-ficew \(S\); then, removing the champ, I tu:ned the ferew by its hendle 9 revolutions, till the interfec. tion markell 240 came nearly to the wire; then, unturning the firger-fcrew S, I releafed the frow from the whect, and turned the wheel back till the interfection matked 2 exact!y caincided with the wire, and, by means of the clamp beforementioned, the divifion 10 on the circle being fet to its inder, the ferew was preffed againt the ecige of the wheel by the fingerferew \(S\); the clamps were removed. and the ferew turned nine revolutions till the interfection marked a nearly coincided with the fixed "ire; the ferew was releaful from the whed ly untarning the finger-frew is as before, the wheel was turned back till the interiection 3 coincided with the fixed wire; the divifion 10 on the circle being fet to its index, the forew was pre!fed againt the wheel as before, and the forew was thened 1\()\) revolutions, till the interfestion 2 nearly coincided with the fixcol wire, and the forew was releated; and I proceeded in this manner till the teeth were marked round the whole circumference of the wheel. This was repeated three times round, to make the imprelfion of the forew deeper, I then rateled the whel round continually in the fame direction without ere: dilengaging the fcucw; and, in ratching the weel about 300 times round, the teeth were fimithed.
"Now it i, evident, if the circumferen ec oithe wheel was cyen one tootin or ten minutes greater than the ferew would requine, this crror would in the firt in. fance
(1) The interfections are marked for the fhe of timhration, though properly invifbie, they ly ing under the murns ilite.

\section*{R A M}

Ramfilen's Atance be reduced to \(: \frac{1}{4} r\) part of a revolution, or two Machine. feconds and a half; and thefe errers or inequalities of the tecth were equally diftibuted round the wheel at the diflance of nine tecth from cach other. Now, as the ferew in ratching lad continually hold of deveral teeth at the fome time, and, thele conitontly changing, the abovementioned inequalitics foon corrated themfelves, and the teeth wore reduced to a perfect equality. The piece of brafs which carries the wire was now taken aw:y, and the cuting forew was alfo removed, and a plain one (hereafter deferiled) put in its place: on one end of the forew is a trabll brafs circle, having its edge divided into 60 equal parts, and numbered at every lixih divifion, as beforementioncd. On the other cud of the forew is a mathet-whecl C, having 60 teeth,
Tig. 5: covered by the hollowed circle (d), which carries two clicks that eatch upon the oppolite fiules of the ratchet when the ferew is to be moved forvards. The cylinder S turns on a flong ftecl abor \(F\), which paffes through and is firmly ferewed to the piece \(I^{r}\) : this
- picce, for greater firmnefs, is attached to the ferew:

Fig. 4. frame \(G\) by the braces (v): a jpiral grcove or thread is cut on the cutfide of the cylinder \(S\), which ferves both for holding the ftring, and alfo giving motion to the lever. J on its centre by means of a flecl tooth ( \(n\) ), that works between the threads of the fpiral. To the lever is atlached a ftrong fteel pin \((\mathrm{m})\), on which a brals focket ( \(r\) ) turns : this focket palles through a flit in the piece ( \(p\) ), and may be tightened in any part of the fiit by the finger-nut ( \(f\) ) : this piece feives to regulate the number of revolutions of the forew fur cach trcad of the treadle \(R\).
" T is a braf, box containing a fpiral ipring; a
Fig. x. Jlong gut is taftenced and eurned three or four times
Fig. x. round the circumference if this box; the sut then paftes fereral times round the cylinder \(S\), and from thence down to the treadie R. Now, when the treadle is preffed down, the fring pulls the cylinder \(S\) round its axis, and the clicks catching hold of the teeth on the ratchet carry the forew sound with it, till, by the tonth ( n ) working in the firal groowe, the lever J is
Tig. 4. Urought near the wheel (d), and the cylinder fop ped by the forew-liead (x) flriking on the top ol the lever \(J\); at the fame time the fpring is wound up by the other end of the gut pathing round the box 'l. Now,
Fig. 1 . When the foot is taken of the treadle, the fpring unbending itfelf pulls back the cylinder, the clicks leaving the ratchet and forew at relt till the picce ( \(t\) ) frilics on the end of the picce ( \(p\) ) : the number of revolutions Fig. 1. of the ferew at each thread is limited by the number of revolutions the cylinder is alloweal to turn back before the Anpfrikes on the piece ( p ).
"When the endlefs forew was moved round its axis with a confiderable velocity, it would continue that motion a little after the cylinder \(S\) was fopped: to
Jig. x.\& 4 . prevent thus, the angular lever was nade: that when the lever I comes near to Atop the forew ( \(x\) ), it, by a fmall chamfer, prelfes down the picce a of the ancular lever; this brings the other end \(x\) of the fame lever forwards, and fopps the endlefs forew by the feel pin \(\mu\) Ariking upon the top of it: the foot of the lerer is raifed again by a 1 mall fpring prefing on the brace (v).
"D, two clamps, connefted by the piece a, flite rig. \(1,2,6\), one on each arm of the frame \(L\), and may be fixed at
pleafure by the four finger-ferews , which prefs aginnt Ramflen's llecl fprings to avoid fpoibit the arms : the picec (q) Martre. is made to tern without fhate betwecn two conical pointal lerews (f), which are prevonted from unturning loy tightening the finger-nuts N .
" The piece M is made to turn on the piece ( \(\eta\) ), by Fig. \(\sigma^{\circ}\). the conical pronted ferews (f) relting in the hollow centers (c).
"As there is frequent occafion to cut divifons on inclined planes, for that purpofe the picce ; , in which the tracer is fixed, has a conical axis at each ond, which turn in half holes: when the tracer is fet to any inclination, it nay be fixed thore by tightoning the fleel ferews \(\beta\).

Defcription of the Engine by culiath the cndly. fs foreav of the Diveding Enrine wots cut.
"Fig. 9. reprefents this engine of its full dimenfions feen from one lide.
"Fig. S. the upper fide of the fame as feen from above.
"A reprefents a triangular bar of feel, to which the triangular holes in the pieces \(D\) and \(C\) ane accurately fitted, and may be fixed on any part of the bar by the ferews 1 ).
" \(E\) is a piece of feel whereon the ferew is intended to be cut; which, after boing hardened and tempered. has its pivots turned in the form of two fruftmms of cones, as reprefented in the drawings of the diviting engine (fig. 5.). Thefe pivots were exadly foted io the balf holes \(F\) and ' 1 ', which were kept together by the forews \(Z\).
"H reprefents a ferew of untempered Acel, havines a pivot I, which turns in the hole К. At the other end of the ferew is a hollow centre, which reccives atic hardened conical point of the ttcel pin M. When this point is fufficiently preffed argan't the forew, to prevent its fhoking, the fieel pin may be fixed by tightening the firews \(Y\).
" N is a cylindric nut, moveable on the forew H ; which, to prevent any fhake, may be tig! tencd by the fereers \(O\). 'Ihis nut is comuched with the faldlepiece \(P\) by means of the intermediate miverfal joint W, through which the arbor of the frew \(H\) palfes. A front view of this piece, with a fection ac:ofs the forew arbor, is teprefented at X . This jnint is comected with the nut by mans of two lteel tlips \(S\), which turn on pins between the cheeks ' I ' onn the nut N . 'lhe other ends of thefe flips \(S\) turn in like manner on pins (a). Onc asis of this joint turns in a hole in the cock (b), which is fixed to the faddle-piece; whd the other turns in a hole (d), made for that purpore in the fame piece on which the cock (b) is fixed. Liy this means, when the forew is turncd round, the faddle-piece will flise uniformly along the trimsular bar \(A\).
"IV is a fratl triangular bar of well-iempered fteei, which 隹es in a groore of the fime form on the faddle piece P. The mint of this bar or cutte is formed to the thape of tie thread intended :o s a on the endef ferew. When the custer is iet th .. proper hold of the intended firew, it may be
tightening the forew (e), which prest the i is of brals Ca uponit.

thend in a handred comfer than the guide.ferem \(H\). The wheels on the guide ferew :ubor 11, and that on the feel \(E\), on which the fetew was to be cut, were proportioned to each othcr top produce that ofiect, by giving the wheel I 195 teeth, and the wheel o 200. Thefe wheels communicated with each other by neans of the intermediate wheel R, which alfo ferved to give the threads on the two ferews the fume dirention.
"The faddle-piece \(P\) is confined on the bar \(A\) by means of the pieces ( g ), and may be made to flide with at proper degree of tightnefs by the fcrews ( \(n\) )."

For Ramiden's cquatorial or portable obfervatory, fee Optics, \(n^{\circ}\) 102. and Astronomy, \(n^{\circ}\) 504. See alfo a long account of au equatorial inftrument made by Mr Ramflen by the dixection of Sir George shuckburgla in the Philofophical Tranfactions for 1793 , attex. p. 67 . In this inftrument the circle of declinations is four feet in diameter, and may he obfervel nearly to at fucond. The glafs is placed between fix pillars, which form the axis of the machine, and tun round by two pirots placed on two blocks of fone. See allo Larometer.

RAMSEY, a town of Huntinglonhire, 68 miles north of London, and 12 north ealt of Huntingdon. It is filuaied as it were in ann illand, being crerywhese encompafled with fens, except on the weil, where it is feparated from the terra firma by a cauley for two miles. The neighbouring meers of Ramfey and Whitlefey, which are formed by the river Nyme, abound with fowl and fith, efpecially cel and large pikes. It was once famous for a very rich abbey, patt of the gatchoure of which is fill ftanding, and a neglecled ftatue of Ailwin; the epitaph of whofe tonib, which is reckoned ane of the oldeft pieces of Englifh fculpture extant, Atyles hins "kinfman of the famons King Edward, alderman of all England, and the miraculous founder of this abbey." It was dedicated to St Dunftan, and its abbots were mitred, and fat in parliament; and fo many kings of England were be:iefinctors to it, that its yeasly rents, fays Camden, were 70001 . The town was then called Ramfey the Rich; but by the difilutuon of the abbey it foon became poor, and even loot its marlet for many years, till about 185 years ago it recoreeed it. It is held on Saturday, and is rectoned one of the moft plentiful and cheapeit in England. In the year 1721 a great number of Roman coins were found here, fippofed to have becu hid by the monks on fome incurfion of the Dancs. There is a charity fchool in the town for poor girls. W. Long. o. 19. N. Lat. 52. 26.

Ranisey, an ifland of fouth TVales, on the coaf of Pembrokethire, abnut two miles in leng th, and a mile and a hall broad. Near it are feveral fmall ones, known by the name of the lifhop anal bis clerks. It is four miles weft of St David's, and 17 norlh.weft of Milford laven. It helongs to the bithopric of St Divid's, and was in the latt age, fays Camden, famous for the death of oue Juitinian, a moft holy man, who reliring hither from Bitanny, in that age rich in faints, and levoting himfelf entirely to God, lived a long white in folitude, and being at laft murdered by lis fervant was entolled among the martyrs. W. Long. 5 ? 0 . N. Lat. \(51.55^{\circ}\)

Ramser, in the life of Man, to the north, a molt
noted and fiacious haven, in which the greatelt flect may Ramfare side at anchor with fatety enough from all winds but the north-calf, and in that cafe they need not be embayed. This town fanding upon a beach of loofe fand, or thingle, is in danger, if not timely prevented, of being wafhed away by the fea.

RAMSGATE, a fer-port town of Kent, in the ifle of Thanet, live miles from Margate, where a very fine pier has been latel) built for the fecurity of thips that come into the harbour, being feated near the Downs, betucen the north and fouth Foreland, 10 miles northealt of Canterbury. The torn is fituated in the cove of a chalky cliff. It was formerly but an obfcure fithing village, but fince the year 1688 has been improved and enlarged by a fuccefiful trade to Rufia and the calt country. Wut what renders it moft worthy of notice, and attracts multitudes of Arangers, is the new harbour, which is one of the molt capacions in England, if not in Europe. It was begun in the year 1750, but delayed by varint!s interraptions. It confits of two piers; that to the eaf is built wholly of Purbeck fone, and estends itfelf into the ocean mear Soo feet before it forms an angle; its becarth on the top is 26 feet, inchading a ftroig parapet wall, which zuns along the ontide of it. The other to the welt is confructed of wood as far as the low-water mark, but the relt is of ttone. The angles, of which there are five in each pier, confirt of 160 fect each, with octagones at the end of 60 feet diameter, leaving an entrauce of 200 feet into the harbour, the depth of which adnits of a gradual increafe of 18 to 36 feet. E. Lorg. 1. 3 3. N Lat. 5 1. 22.

RAMTRUT, a deity worfhipped by the Ranazins of Hindoltan, where he has a celebrated temple at Onor. He is reprefented as more refembling a monkey than a man.

RAMUS, in general, denotes a branch of any thing, as of a trec, an attery, \&c. In the anatomy of plants it means the firtt or lateral branclies, which go off from the petiolum, or middle rib of a leaf. The fubdivifions of thefe are called furculi; and the final divifions into the molt minute of all, are by fome called cupillamonta; but both kinds are generally denuminated furculus.

Ramus (Peter), was one of the mot famous profefiors of the rath century. He was born in Picardy in 3515. A thirf for learning prompted him to go to Paris when very young, and he was admitted a fervant in the college of Navare. Spending the day in waiting on his matters, and the greatelt part of the right in ftudy, he made fuch furpiimg progrefs, that, when he tuol: his mater of ants degree, he offered to maintain a quite oppofite doctime to that of Arinotle. 'This raifed thim many enemies; and the two firf books he publifhed, Infitutiones Diule大ice, and Arifoo telice Animurdverfioncs, riccationed great diturbances in the univerfity of Paris: and the oppoftion agamet hins was not a little heightened by his deferting the Romith religion, and profeling that of the Reformed. Being thus forced to setire from Paris, he vified the univerfitics of Gernany, and received great honours whereever he came. He returned to Eratice in \(1: 71\), and loft his life miferably in the hortid matacre of St Dattholomew's day. He was a greatorator, a man of univerfallemrning, and endowed with yery fine mosal quali-

\section*{R A M \\ [ 799 \\ R A N}

Ramus. ties. Fie publifhed many books, which Teilfier enumerates. Ramus's merit in his oppofition to Ariltotle, and his firmnefs in undermining his authority, is unqueftionably great. But it has been doubted, and with much reaion, whether he was equally fuccefsful in his attempts after a new logical inllitute. We have the following general outlinc of his plan in Dr Enfield's Hiftory of Mailofophy. "Confidering dialeatics as the art of deducing conclufions from premifes, he endeavours to improve this art, by uniting it with that of rhetoric. Of the feveral branches of rhetoric, he confiders invention and difpolition as belouging equally to logic. Making Clicero his chief guide, he divides his treatife on dialectics into two parts, the firf of which treats of the invention of arguments, the feend of judgments. Arguments he derives not only from what the Ariftotelians call middle terms, but from any kind of propolition, which, connected with another, may ferve to prove any affertion. Of thefe he enumerates various kinds. Judgments he divides into axioms, or felfevident propofitions, and diazż̈̈a, or deductions by means of a feries of arguments. Both thefe he divides into various clafics; and illuflrates the whole by examples from the ancient orators and poets.
"In the logic of Ramus, many things are borrowed from Ariftotle, and only appear under new names; and many others are derived from other Grecian fources,
particularly from the dialogues of P'ato, and the logic of the Stoics. The author has the merit of turning the art of reaforing from the futile fpeculations of the fehools to forenfic and common ufe; but his plan is defertive in contining the whole dialcatic art to the fingle object of difputation, and in omitting many thing, which refpect the general culture of the ran derfanding and the inveltigation of truth. Notwithflanding the defens of his fyftem, we cannot however, fubleribe to the fevere cenfure which has been palied upon Ramus by Lord Bacon and others; for much is, we think, due to him for having with fo much firmnefs and perfeverance afferted the natural frecdom of the human underfanding, The logic of Ramus obtained great autherity in the Chools of Germany, Great Britain, Holland, and France; and long and violent contefts arofe between his followers and thofe of the Stagyrite, till his fame vaniflaed before that of Defcartes."

RAN, in the old Englifa writers, means open or public robbery, fo manifen as not to be denied. Ran dicitur operta rapina que negari non potefl. Lamb. 125. Leeg. Canut. cap. 58. Hence it is now commonly faid of one who takes the goods of another injurioully and vio-
lently, that he has taken or fratched all he could rap and ran.

RANA, or Ranula. See Ranula.

\title{
The following Vindication of the Character of George Fox, from the Account given of him in the Encyclopædia, Vol. XV. page 734, was drawn up by the Society called Quakers, and is now printed by their particular \(D_{e}\) fire.
}

\begin{abstract}
To the Editor of the American Edition of the Envcyclopadia, zubercin is revived a falc, and, berctofore fully rcfuted Calumny, traducing the religious Cbaracter of George Fox, called by a fubjoined Note, in the confident Style of autbentic Hifory, an Extract from the Works of Lefley; the following Remarks and \(\mathfrak{L}\) wotations are refpectfully offered; zubereby an \(O p\) portunity may be afforded bis Readers of judging for themfelves what Degree of Credit is refpectively due to Accounts fo effentially oppofite ; and that thereby be may difclaint any injurious Partiality baving inffuenced binn in the Rcpublication of faid Extract.
\end{abstract}

THAT national and political religion has been, and continues to be, mingled w:th human inven. tions and traditions, adapted and fubfervient to the purpofes of lucre, and an imperious domination over the coniciences of men, is evident from its recourfe to a precarious intolerant coercion for fup, ort, through the viciflitudes of human power and authority. The amals of the Stewarts and of Cromwell abound with proofs of a venal priefthood, and their higoted adherents, recurting to human depravity as an engine to uphold their fy tenns of dead works, and maintain their wiurpation of the divine prerogative: many are the inftances to be found on record of thofe finifler pretenders to zeal for religion, exerting all their influence with the populace to excite them to tumuluous afts of violence and cruelty againd innocent men and women, who were eminent examples of piety and virtue, becaufe they believed it their duty to bear teltimony to a free Gofpel minitry, uninfluenced by the fordid motives of earthly emolument, and manifefled their love of their neighbour by affectionately and fervently inviting them to an inward astention to the vital principle of true religion, imparted to the and of crery rarional creature; boldly declaring and publifhing their faith (confirmed by undeniable Scrifture teltimony) in this pure emanation of the Divine Nature, as the only infallible teacher, and fure guide to felicity: for this their benevolent and acive zeal in aferting and diffeminating thofe truly Chriftian doctrincs, and for their unhaken adherence thereto, exemplified in a godly cir.
cumfpetion of life, and plain fimplicity of manncrs and communic:tion, mifunderfood as a clownifh fingularity ; they were by bigots to the vain and licentious cutoms prevalent in the world, accounted (as were for like reafons, the primitive followers of Chrif) peftilent difturbers, and turners of the worlit upfide down, their religion being irreconcilatle to that which, through the devices of unfanettied wifdom, is modelled and accommodated to favour the ambitious aims and felfilh views of thofe whofe minds the god of this zworld bath blinded, who as they could not comprehend, or were unwilling to become fubject to the infpeaking divine law of truth and righteoufief, which thofe unmodifh innocents bore witnefs to, fo their pride could not endure, but took high offence at the unflattering, though really inoflenfive plainnefs of the language and demeanor of thofe patient and fledfalt exanules and promoters of good will to men. Hence the many unmerited reproaches, fornful epithets, and nicknames, among which that of Qutkers was early beflowed on this periple ; their practical adherence to Gofpel principles made a fubject of fcoff and ridicule; the phrafes or mojes of expreffion ufed by fome of the illiterate among them, perverted to the purpefes of abufe and fander. Of this complexion are the generality of afperfions calt on George Fox, one of which, claiming fpecial notice on the prefent occafion, is a fabrication attributed to one Lefley, reputed author of a publication entitled The Snake in the Grafs. From this writer's works is faid to be extracted, a letter from George Fox to Oliver Cromwell, a palpable pervertion; of which, were there no other proofs, a candid comparifon of it with the general tenor of George Fox's writings, carefully preferved, might fufficiently convince the unprejudiced of its being a piece of mockery, intended to difcredit the religious principles of the pcople called Quakers, thro \({ }^{2}\) a mimicry of the fyle of George Fox, and making ufe of fome of the expreffions contained in his genuine letter to Oliver Cromwell, of which this forgery is pretended to be a copy. The true purport of faid genuine letter, with the circunifances leading to, and accompanying it, as cited from unimpeachable authority, by J. Gough in his Hiftory of the People called Unakers, Vol. I. p. 155 . being as follows :
"He (George Fox) went from Drayton to Leicef. ter, and from thence to Whetfone, where a meeting was to be held; but before it hegan, about feventeen troopers of Coionel Hacker's regiment wook him up ans
and brought him before the Colonel and his company of officers, by the procurement of the prielts, as lie thought ; and after much difcourfe and reafoning with them, the Colonel gave lim liberty to go bone, provided be avould glay there and not so abroad to mecting; but George being unwilling to agree to the conditions, his fon Nedham faid, 'Faller, this man hath reigned too long, it is time to have him cut off.' So malicious a fpeech drew from George this pertinent querie ; - For what? What have I done? Or who have I wrongcd from a child? In this country I had my birth and e lucation, and who can accufe me of any evil from my infancy to this day ?" Then the Colonel atked him if he would go home, and ttay at home? George, looking upon this requiftion as unreafonable, having adminiftered no caufe for fuch reftriction of his liberty, repli. ed, if he foould agree thereto it would infly that be auas gnilly of fomething for which his home was made his prifon : and if be quent to meting, they would conjider that as a brach of their order; therefore be p'ainly tolt then: be frould go to meeting, and could not anfwer their repuirings.
Well then,' faid Hacker, 'I will fend you tomorrow morning by 6 o'clock io my lord Protector, by Captain Drury, one of his life guard.' That night he was kept in the Marfheliea, and next morning about the hour appointed delivered to Captain Drury. But before they fet off, requefting to fpeak with Colonel Hacker, he was taken to his bedfide, when the Colonel repeated his order to him to go home and ftay there: and George being fill unwilling to comply, the Colonel infifted on his going to the Protector. Whereupon George kneeled down at his bedfide and prayed the Lord to forgive him: looking upon him to be like Pi. late, willing to wath his hands while he complied with the inftigations of the perfecuting priefts; and therefore defired him, suben the day of his mifery and tioll cune upon bim, then to remenber what be bud fid to bin (A.) so parting from him, lie was carried prifiner by Cap. tain Drury to London, where, being lodged at the Mermaid, Charing Crofs, Drury went to inform the Protector, who fent him back with this meffage, that the Protector required of George Fox that he thould promife not to take up the lword, or any other weapon, againt him or the government, as it then was ; that he thould write it in what words he faw proper, and fet his hand to it. George, on confideration thereof, wrote to the Protector the next monning by the name of Oliver Cromwell, declating in the prefence of the Lord, that be did deny the wearing or drawing of a fword, or any outward weapon againt him or any man. That he was fent of Gid to ftand a witnets agrainft all violence, and againtt the works of darknels; and to bring people fiom the occafion of wars and firght. ings to the peaceable Cofpel; and from being evil doers, to whom the magiftrates' fword thould be a terror ; to which he fubfcribed his mame and gave it to Captain Drury to deliver to Cromwell. Some time atter Drury retuned, and bronght Gearge Fox before the Protector at Whitehall. Upon his coming in he faid, Peace be in this houfe; and exhorted the Protector to keep in the
fear of God, that he might receine wifdom from bim; that by it he might be ordered, and with it might order all things under bis band to God"s glory. They had much dif. courfe about religion, in which the Protector carried himfelf with much moderation : but remarking that George Fow and his friena's quarreled with the miniflers, George told him he did not quarrel with them, but they quarreled with him; but, added he, if we own the prophets, Chrift, and the apolles, we cannot uphold fuch teachers as they teltified againt, that is, fuch as violate Chrilt's commands in not giving freely : fuch as take the overfight of the flock for filthy luere and divine for mones. When George made a motion to retire, upon other people coming in, Cromwell took hin by the luand, and with tears in his eyes luid, Come again to my lioure, for if thou and I were but an hour of a day together, we fhould be nearer one \(t \in\) another; adding, that he withed him no more ill than he did his own foul. Then George bade him hearken to the voice of God, fland in his countel and obey it, if he did fo it would preferve him from hardnefs of heart, but if not, his heart would be hardened. The Portector feemed affected, and faid it was true. George then taking his leave retired, and Caprain Drury following him out, informed him that the Lord Protector faid he was at liberty, and might go whither he would."

The adverfaries of this religious fociety manifefted a peculiar enmity againtt George Fox, and to their own degradation, in not a few inftances, alleged things refpecting him, bntli abfolutely falfe and grolsly abfurd (s). By fuch prattice and defamations he ap. pears to be confidered a wild fanatic and mad enthuliant, by thofe who knew little of him, and had little inclination to be better informed, willing to abide under prejudice rather than liften to any thing tending to re. move it; while thofe who knew him beft, and are molt to be depended on for a true account of him, do teftily that he had a fair, reafonable, and equitable claim to the apofle's defence-" I am not mad; but fpeats forth the words of truth and fobernefs."
Joleph Plipps, in his book entit!ed The Original and Prefent State of Man, \&c. page 162. in anfiver to the ill-founded cavils of S. Newton againtt George Fox, gives the following account of him, the veracity whereof is prefumed to be fupportable by more authentic teltimonials than any his vilifiers can lubftantiate.
" The fundamentali he preached were, Chrift once in the Helh, and always in ppirit, as the light and life of men, the Mediator, the Propitiation, the Interceffor, the potential and actual Redeemer, offered for all, and to all, and the efpecial Saviour of all that believe in him fo as to obey him; with the neceffity of regenerdtion in \(m\) an, and the practice of every moral and Chriftian virtue.
"Is it nothing extraordinary, that a perfon fo obfcure and illiterate, fo little converiant amongit men, fo uneducated in arts, languages, and fciences, fo unverfed in the various modes of divinity, by turns in
fallion,
(A) Which he did when near his execution, being tried and condemned in 1650 , as one of the judges of King Charles 1.
(B) The forry fictions of Marfhan afford a fample in kind, See Gough's Hittory, Vol. I. p. ing.
f. Thion, uninfiructed, unprovided, unprotected by men, fhould fingly and alone launch into the troubled fea of a tempenlnous flutating world, and in direct oppofition to all the pride, policy, and power of a learned and hacrative prieftiond, and a prejudiced peeple with a bigoted magillacy at their head; that finch an one, by the limile doatrine of the crofs of Chrit, thould be made inftrumental to the turning of thoulands, not from form to form, but from darknets to hight; from the power of Satan to the power of God ; from a death in lia, to at lite of righteoufnefs; from habituat vice, to a ccurie of viztue, infomuch that fome judicious magitrates declarer, the people raifed through his miwiltry, eafed their hands of much trouble ; and had it zut been for the ipeading of this principle of divine light, the nation would have been overrun with rantarifn and licentioutnes. In this great and grod work, George liox, with the people he had been inflrumental to rale, flood with unabated conrage and conlt.ancy, and we:e enabled, with undanted fortitude to bear up againft near forty years eruel perfecution, with fimall intervals, both from royal and republican parties, as each afead ded the fcale of nationat power. This he was favoured to fee all end of, before his removal begond the noife of anchers, and out of the sach of envy and malignity."

The fanc author, parge 209. fhewing faid Newton's falle citation from George Fox's Great Myftery, and perverfinin of his true meaning, adds,
"Gcorge Foxes Treatife was printed in 1659, and cont:uns curfory anfivers to above an hundred different oppofers, who in a manner mobbed him from the prefs at that contentious period; and as he had full employment for his time otherwife, and had not the benefit of that licerature which is now common, infamous advantages then were, and have often lince been taken by deligning antagonifts, of the inaecuracy of his expreffions. But I thould think it beneath any perfon of a liberal education and character, to copy from thofe ill-intenders, or to follow them in fuch a dimgenuous line."

In point of veracity, and intimate knowledge of the true, rational, moral, and religious character of George Fox, it is prefumed that, amongt his revilers, or thofe who thew a fondnefs for reviving their calumnies, no authority can be produced which, with judge: ingerioous of temper and upright of meaning, will be held more unquellionably refpectable than that of William Penn, who in his Preface to George Fox's Journal, folio 30. gives this tettimony of him:
" Truly I mult fay, that though God had vifibly cloathed hint with a divine preference and anthority; and indeed his very prefence expreffed a religious majelly, yet he never abufed it, but held his place in the church of God with great meeknefs, and a moft engraging humility and noderation. For upon all occiations, like his bleffed Mafter, he was a fervant io
all, holuing and exercifing his eldaflop in the inviill: power that had gathered them, with revcrence to the head and care over the bods, and was reccivel only in that fpirit and power of Chitl, as the firlt and chia! elder of his age; who as he was therefice worthy if double hnnour, io for the lame reation it was given by the faithful of this day, becaule his authority was intward and not rutward, and that he got it and kept ir by the love of God and power of an endecis life. I write my knowledge and not report, and my witneis is true, having been with him for weeks and months il \(^{-}\) gether on divers occations, and thofe of the nearef! and moft exercifing nature, and that by night and by das, by fea and by land, in this and in foreiga countrics; and I can fay I never faw him out of his phice or rot a match for every fervice or occation. For in all thing he acquitted himfelf like a man, yeu a flong man, is new and heavenly-minded man. A divine, and a n:aiuralif, and all of God Almighty's making. I have been furprifed at his queftions and anfwers in natural things, that whilth he was ignorant in ufelef and fophiftical fcience, he had in thim the foundation of ufeful and commendable knowledge, and cherifhed it every where. Civil beyond all forms of breeding in his belhaviour; very temperate, eating little and fleeping lefs, though a bulky perion."

Such is the clear, unambiguous account given of this grofsly-abufed, much-enduring fervant of Jefus Chrift ; not only by William Penn, but alfo by other his cotemporaries, nearly intimate and thoroughily acquainted with him.

Terms of fcoff and derifion are not uncommon with thofe who have no better authority for thcir envious declamation; thus we find in the paragraph following the extract from Lefley, the fcornful addition of fentielef's enthufiaft tacked to the name of Ceorge Fox; but where does there appear any ground for fich imputation? Will it be alleged that it is amply fhewn in that curious preceding fabrication? If that be admitted a true copy of George Fox's letter to Oliver Cromwell, it aff ids ample ground indeed; but that forgery de. tects itfelf: Who, acquainted with the hiftory and fipirit of thofe times, muft not be convinced that George Fox, fetting his name to fuch a compound of blafphemons abfurdity, could not have efcaped a very eruel punihment. Were not the adveriaries of the defpifed people called Quakers induttrioufly feeking occation for criminating them? and againf George Fox peculianly, for want of real matter of offence, were not defpicable frauds practifed? Let thofe who wih not to be impofed on, fearch, like the noble Bereans, and fatisfy themelves of truth and fact (c).

The hold affertion that a number of learned and ingenious men, joining the Quakers, new modelled their creed, is totally deftitute of fupport from any creditable authority. That men of piety and ability defended and illuftrated the doatrines and tenets taught and
(c) See Gough's Hifory, Vol. I. p. 122. Recital of a formidalle combination by procurenent of falfe wit. neffes, to convift George Fox of blafpliemy. The account likewife which this author gives in the famc volume, page 80, of the occafion of difgult againtt the people called Quakers, has a claim to the attention of honeft inquirers, as has his eitations fiom divers detracors, with his remarks thereon, fhewing their partial and difingenuous colouring, particularly frum D. Neal's works, p. 83. 85. 26. 354-357. Nolheim's illiberal mifreprefentations alfo cited and expofed-fime book, p. 100. 249.

\section*{[ 4 ]}
and publifned with indefatigable diligence and uncon- earnefly contended for, as the faith once delivered to the querable patience by George Fox, is undeniably true. Saints : confiftent and harmonizing with this great funWhat wele in thofe doctrines and tenets, unconform- damental, as its natural brancles, are the tenets proable to the true Chrifian fandard? What did they con- feffed, and tellimonies borne, by George Fox, with tain that could flock common fenfe, unlefs it were the whom therein the people called Quakers have ever common fenfe of bizots to an earthly, political form of been, and continue united; any wort or contrivance of
religion, from which they fought worldly exaltation and gain?

The religious principles originally profeffed and practically adbered to by George Fox and his fellow labonrers, under the infuence of Gofpel love, have con. inued and remain, without variatica, the principles of the people called Quakers to this day.

George Fox, deeply learned in the knowledge of things fpiritual and divine, thougls not ingenious in the artificial arrangement of words and fentences, was peculiarly exercifed in arduons endeavours to excite to fuch an introverfion of mind as might, under divine favour, afford a fight and fenfe of the hcavenly efficacy of the grace of God, in its faving and purifying operation; the un veriality and fufficiency wherenf he
learned ingenious men, by them as a religious body, owned, to nerw model this creed, cannot be made appear: fuch pretended reform, therefore, attributed to human learning and ingenuity (by fome fo much preferred to the falutary work of divine grace) is a mere arbitrary, unfounded affumption. How the writer of this paragraph came by his account, which is a direct falfehood, that \(G\). Keith was excommanicated for the liber ties be look zuith the grcat apofle (if George Fox be thereby meant) vill be proper for him or his adherents to fhew ; how, or in what inftance, Keith's suritings contributed to the moderation of Penn, or to the elegant and mafferly Apology of Barclay, is left to be made out by the learning and ingenuity of the fame writer.
